Measles Travel Health Notice

# Mélioïdose, Australie

## 9 cas de mélioïdose dont 1 décès en Australie à Cairns après le passage du cyclone tropical KIRRILY

- Un patient de Cairns est décédé de la mélioïdose, une maladie bactérienne, et les autorités sanitaires du sud ont averti les personnes effectuant le nettoyage à la suite du cyclone tropical KIRRILY de prendre des précautions pour éviter de contracter l'infection.
- Le Dr Nishila Moodley, du bureau de santé publique de Townsville, a déclaré que les bactéries vivant dans le sol pourraient être exposées après de fortes pluies, exposant ainsi les personnes à un risque de développer une mélioïdose.
- Queensland Health a mis en garde cette semaine contre un pic de **neuf cas** dans la région de Cairns jusqu'à présent en janvier, à la suite de fortes pluies et d'inondations déclenchées par l'ancien cyclone tropical Jasper.
- La mélioïdose entraîne la mort dans jusqu'à 20 pour cent des cas traités.

# Ross Fever Virus, Australia

Over the Easter long weekend every year, many Australians head out on camping trips or up to Queensland to make the most of the warm weather.

This year [2024], they are being advised to take precautions against the Ross River virus as cases surge in the Sunshine State, **with more than 1500 detected since January**.

Here's what you need to know about the virus -- and what you can do to protect yourself.

What is Ross River virus?

Ross River virus, also known as **epidemic polyarthritis**, is an infection spread to humans by infected mosquitoes.

It is the most common mosquito-borne disease in Australia. **It is not spread directly from person to person.**

**Many people infected with the virus never get symptoms, but others will experience painful, swollen joints and muscle and tendon pain. Other symptoms can include fever, headache, fatigue, a raised red rash, and swollen lymph nodes.**

Some adults recover within a few weeks, while others will experience **symptoms for months**. A small number will still have symptoms after a year.

Where are Ross River virus cases rising?

Ross River virus infection is considered endemic to many parts of the country but is most common in tropical areas of Queensland, the Northern Territory, and Western Australia.

Surveillance detected a **high number of mosquitoes carrying the virus** across 9 different local government areas stretching from Mackay down to south-east Queensland.

Queensland Chief Health Officer Dr John Gerrard said the infections typically rise with the onset of **rain and warm temperatures in December, before peaking in February and March.**

How can you protect yourself from Ross River virus?

There is no vaccine for Ross River virus infection, but there are several measures you can take to help protect yourself.

Gerrard recommended staying vigilant of mosquitoes, particularly at dusk and dawn when some species are most active.

"Measures to prevent mosquito bites include regularly applying insect repellent containing DEET, picardin, or oil of lemon eucalyptus and wearing loose, light-coloured clothing to cover up arms, legs, and feet," he said.

"Around your home, you should empty containers holding water or remove standing water wherever possible, at least weekly, and ensure flyscreens are in good order so mosquitoes can't enter your home easily."

# Dengue, Amérique du Sud

## Epidémie majeure de dengue en Amérique Centrale et du Sud

### Central America

Guatemala. 8 Mar 2024. (Reported) as of 17 Feb 2024, 6760 cases; Severe cases 31; Deaths 3.

Panama. 10 Mar 2024. (Reported) 2745 cases; Serious cases 14;

Regions most affected: Panama Metro, Panama Oeste, Colón, Chiriquí and Panamá Este.

### Caribbean

Dominican Republic. 5 Mar 2024. (Reported) 3889 cases in 1st 5 weeks of 2024.

Puerto Rico. 29 Mar 2924. (Registered), 549 cases, public health emergency declared.

### South America

Argentina. 12 Mar 2024. (Reported) in January and February 2024, 78 606 cases; Deaths 47 in these provinces: Chaco (12), Corrientes (8), Córdoba (3), Entre Ríos (1), Formosa (5), Misiones (13), Buenos Aires (11), Santa Fe (2), Tucumán (1), Santiago del Estero (1); Dengue serotypes circulating: DEN-1, DEN-2 y DEN-3 with DEN-2 predominant followed by DEN-1.

Brazil. 21 Mar 2024. (Reported) more than 2 million cases; Affected states: Acre, Espírito Santo, Goiás, Minas Gerais,, Rio de Janeiro, São Paulo, Paraná, Rio Grande do Sul, Santa Catarina, Distrito Federal; Health emergency declared.

[A 30 Mar 2024 update reported 2 486 502 confirmed cases, 897 deaths with 1337 additional deaths under investigation.

Peru. 22 Mar 2024. (Registered) 79 741, 262,2% more than last year (2023); Deaths 82; Regions most affected:: La Libertad (16 247 cases), Lima (12 306), Piura (11 470), Ica (10 909), Llama (8.623).

Ecuador. 16 Mar 2024. (Confirmed) 11 492 cases; Provinces affected: Santo Domingo de los Tsáchilas, Manabí, Los Ríos, El Oro, Guayas; Deaths 15 with 6 adults, 9 children; Dengue viruses circulating: DENV-1, DENV-2, DENV-3 (for the 1st time).

Uruguay. 4 Mar 2024. (Confirmed) 32 imported cases, 2 locally acquired cases.

# Oropouche Virus, Brésil, Bolivie

## 1398 cas confirmés de Fièvre d'Oropouche dans le Nord du Brésil, 134 cas confirmés en Bolivie

- La fièvre Oropouche est une maladie zoonotique principalement transmise par des moucherons de l'espèce *Culicoides paraensis*.
- Bien que le virus ait été découvert en 1955, une plus grande attention a été accordée récemment au virus et à la maladie en raison d'épidémies de fièvre Oropouche dans différentes régions du Brésil et du Pérou.
- Des études sérologiques chez l'homme et les mammifères sauvages ont également détecté le virus Oropouche en Argentine, en Bolivie, en Colombie et en Équateur.
- Plusieurs mammifères agissent comme réservoirs de la maladie, même si le cycle sylvatique du virus Oropouche reste à bien évaluer.
- La fièvre Oropouche ne présente pas de symptômes clés permettant de la différencier des autres maladies fébriles à arbovirus des Amériques. Des cas sporadiques de méningite aseptique ont également été décrits avec un bon pronostic.
- La perte d'habitat peut augmenter la probabilité d'émergence du virus Oropouche à court terme en Amérique du Sud.

Fig. 5. *Culicoides paraensis*, main vector of Oropouche virus. *Culicoides*

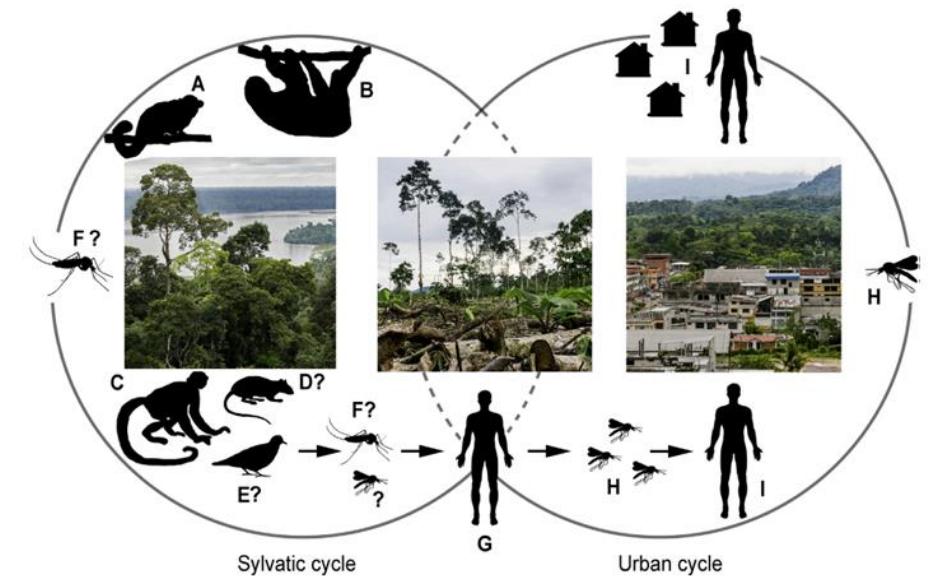

Fig. 4. Life cycle of Oropouche virus in the wild and domestic interface. Sylvatic Oropouche virus cycle includes wild mammals such as *Callithrix penicillata* (A), *Bradyus tridactylus* (B), *Sapajus alouatta* (C), *Allouatta caraya*, and the plausible role of *Proechimys* sp. (D). Oropouche virus also has been isolated from wild birds (E). Mosquito species incriminated in the maintenance of Oropouche virus has been suggested (*Coquillettidia venezuelensis* and *Aedes serratus*, (F)). Anthropogenic disturbance of natural areas may facilitate Oropouche virus spillover to humans (G), generating outbreaks in urban settlements (I). The urban cycle is apparently maintained by *Culicoides paraensis* (H). *Culex quinquefasciatus* has also been implicated in Oropouche virus circulation. The role of *Cu. paraensis* and *Cx. quinquefasciatus* in the sylvatic life cycle is still unclear (F).

# Encéphalite équine de l'ouest, Argentine, Uruguay

## 51 cas d'Encéphalite équine de l'ouest dans la région de Buenos Aires et 4 cas en Uruguay

- There are reports of Western equine encephalitis virus (WEEV) infections in horses, humans or both, in parts of Argentina and Uruguay (see map).
- WEEV is spread mostly by the bite of an infected mosquito and can cause severe disease.
- Severe illness can occur in people of any age; however, young children, particularly infants and children aged <2 years, and older adults are at greater risk for severe illness. Children who develop neurologic disease have a 30% chance of having a permanent disability such as seizures, spasticity, and cognitive or behavioral disorders. Mortality is low, only around 4%.
- Travelers to these areas should take steps to [prevent mosquito bites](#).

Green indicates areas where WEEV infections have been reported in horses, humans or both

## Measles cases in 2024

As of April 11, 2024, a total of **121 measles cases were reported by 18 jurisdictions**: Arizona, California, Florida, Georgia, Illinois, Indiana, Louisiana, Maryland, Michigan, Minnesota, Missouri, New Jersey, New York City, New York State, Ohio, Pennsylvania, Virginia, and Washington. There have been 7 outbreaks (defined as 3 or more related cases) reported in 2024, and 71% of cases (86 of 121) are outbreak-associated.

## Age

Under 5 years: **57 (47%)**  
 5-19 years: **27 (22%)**  
 20+ years: **37 (31%)**

## Vaccination Status

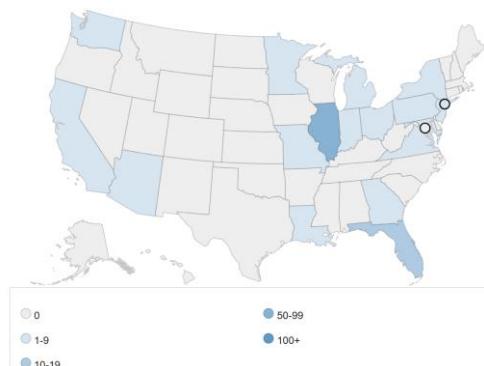

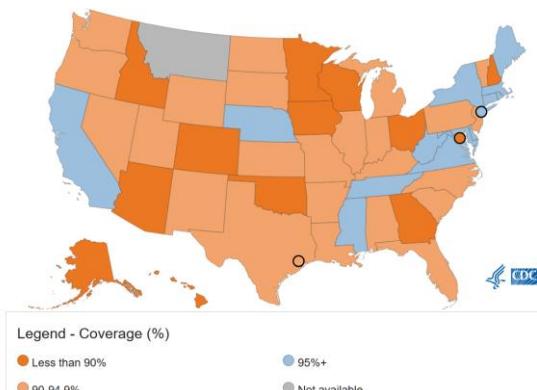

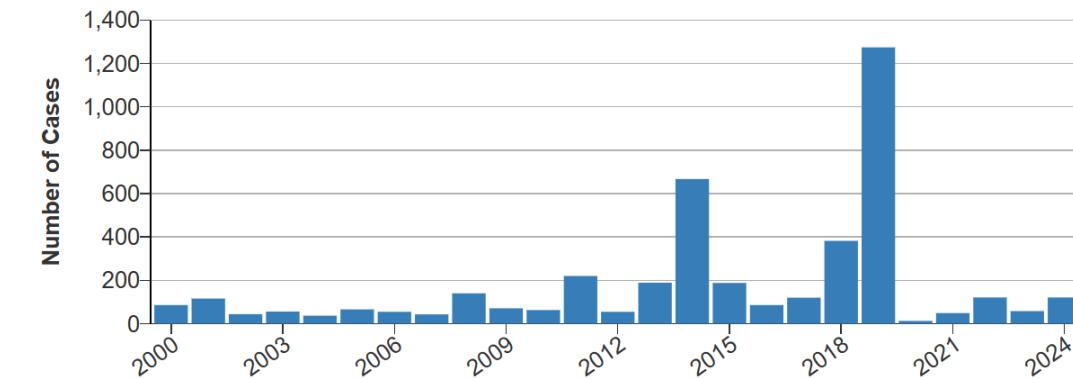

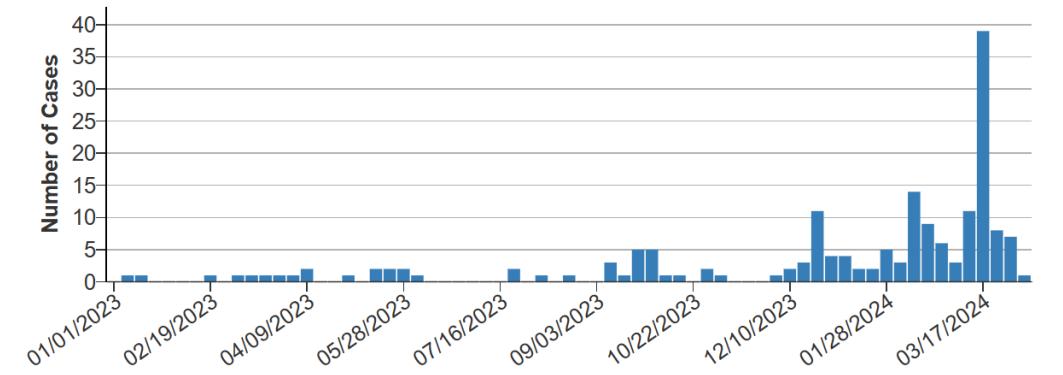

Unvaccinated or Unknown: **82%**  
 One MMR dose: **13%**  
 Two MMR doses: **5%**

**56%**

of cases hospitalized (68 of 121 cases) for isolation or for management of measles complications.

## Percent of Age Group Hospitalized

Under 5 years: **65% (37 of 57)**  
 5-19 years: **37% (10 of 27)**  
 20+ years: **57% (21 of 37)**

# Mpox, République Démocratique du Congo

## Epidémie de Mpox en RDC avec taux de mortalité de 10% touchant principalement les enfants

An mpox outbreak in the Democratic Republic of the Congo (DRC) that began in 2023 has expanded to 23 of the country's 26 provinces, including Kinshasa, with **children the most affected group**.

Health officials said the outbreak is occurring alongside an alarming humanitarian crisis, which includes the world's second biggest refugee displacement and the effects of severe flooding.

The DRC is also battling cholera, measles, anthrax, and plague outbreaks. WHO officials also said that, in most parts of the country, especially the east, residents have been caught in the crossfire of violent clashes, overwhelming hospitals with injured people.

The mpox outbreak involves a different clade of the virus than the one circulating globally. The clade 1 virus in the DRC is known to be more virulent, **with a case-fatality rate (CFR) as high as 10%**. The DRC's outbreak is also notable because it is the first outbreak involving clade 1 that has involved some **sexual spread**, including **heterosexual transmission**.

So far the DRC has reported **3941 suspected mpox cases this year [2024]**, **271 of them fatal**, for a **[CFR] of 7%** - much higher than the global CFR of less than 0.2%. Only 389 of the DRC cases have been lab-confirmed, which the WHO said points to diagnostic challenges in the country.

**Two-thirds of the mpox cases have been reported in children, with a 10% CFR in infants and young children.** The WHO added that the proportion of deaths is rising.

The WHO said the accelerating geographic expansion poses a threat to neighboring countries as well as the wider global community. So far, **no cases of the clade 1 virus circulating in the DRC have been reported outside the country**.

The Republic of Congo recently reported its first mpox cases, though it isn't clear what strain is involved.

The WHO noted that the emergence of gene deletions may affect the ability of  $\geq 2$  other countries to detect imported cases.

In a recent Eurosurveillance report, researchers noted the problems with test reliability in identifying the DRC strain and raised the possibility that at least 2 outbreaks are underway in the DRC.

# Lassa Fever, Nigeria

## 682 cas de Fièvre de Lassa au Nigéria et 128 décès, avec un taux de mortalité de 18.8%

Despite extensive efforts, the Federal Republic of Nigeria continues to confront an expanding Lassa fever outbreak in 2024, reporting new cases and deaths.

Throughout 2024, Nigeria's Centre for Disease Control and Prevention (NCDC) confirmed **682 cases and 128 deaths**, which is a **Lassa fever case fatality rate of 18.8%**, far exceeding the rate recorded in 2023.

The report identified 62% of confirmed cases originating from Ondo, Edo, and Bauchi states.

Without an available vaccine, the US CDC says the risk of Lassa virus infection is associated with peridomestic **rodent exposure**, where inappropriate food storage increases the risk. The CDC says people should practice safe food precautions and avoid handling, cooking, or eating raw or undercooked meat or animal products.

Transmission: inhalation of dust contaminated by rodent droppings, contact with infected rats/humans

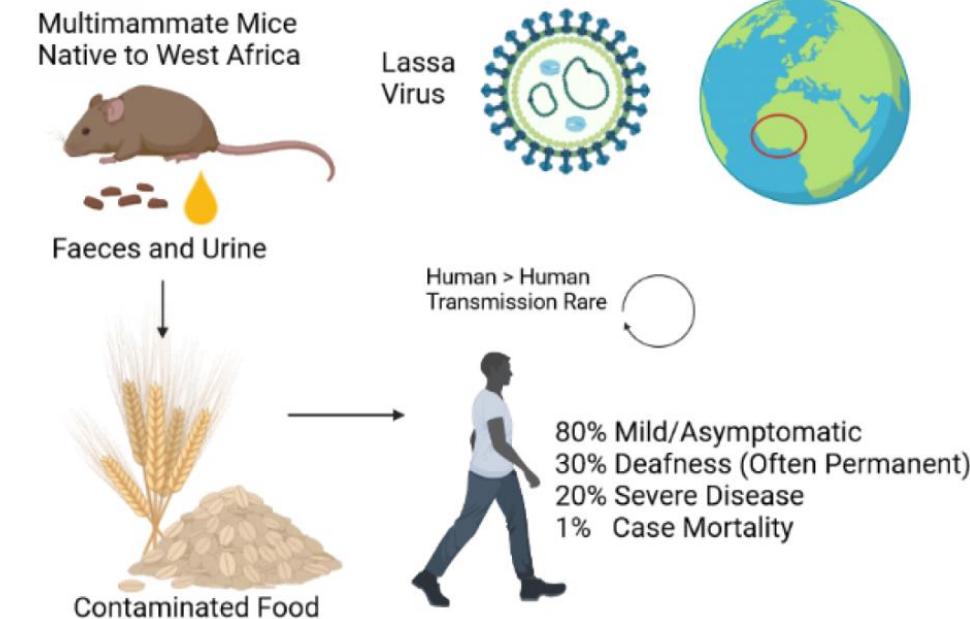

Phase 2 clinical trial underway for first lassa fever virus vaccine candidate. Recombinant viral vector vaccine (using VSV like ZEBOV)

# Diphthérie, Afrique

## Epidémie de Diphthérie en Guinée, Nigeria, Niger, Gabon, and Cameroun

**34 704**

Cumulative  
Suspected cases

**23 883**

Cumulative  
Confirmed cases

**926**

Deaths

**5/7**

Active countries

- As of February 25, 2024, 34,704 suspected cases of diphtheria were reported across Nigeria, Guinea, Niger, Mauritania, South Africa, Cameroon, and Gabon. **Nigeria was the most severely affected, accounting for 78% of cases and 70% of deaths.**
- Mauritania has not reported cases since epi week 44/2023, and the outbreak in Pollsmoor Prison, Western Cape Province, South Africa, has been successfully contained. Therefore, the diphtheria outbreak is no longer active in Mauritania and South Africa. Gabon reported one laboratory confirmed case in the Bitam district, on the border with Cameroon.
- Recent epidemiological trends show a **surge in weekly cases in Guinée and geographical expansion**, contrasting with a decline observed in the remaining affected countries.
- Guinea is the priority country for the next week, while close monitoring is required in Cameroon and Gabon.
- A cross-border coordination and surveillance meeting was held last week between Guinea and Mali.
- 70% of the suspected cases were among 1 to 14-year-old children, 61% of suspected cases are females, and only 24% are fully vaccinated

# Mycoplasma pneumoniae, France

## Points clés au 21 janvier 2024

- Recrudescence des infections à *Mycoplasma pneumoniae* en lien avec la levée des mesures sanitaires et la baisse de l'immunité de la population contre l'infection.
- Part des passages aux urgences pour pneumopathie bactérienne fin décembre (S52) chez les 15-44 ans et les 5-14 ans dépassant largement les valeurs observées lors d'épidémies précédentes, avec des niveaux près de deux et quatre fois supérieurs aux valeurs moyennes de la période de référence 2015-2020 dans ces classes d'âge.
- Peu de souches résistantes aux macrolides (traitement antibiotique de 1re ligne) parmi les prélèvements analysés entre les semaines 27/2023 et 02/2024.
- Au 21 janvier 2024, tendance à la stabilisation ou diminution des indicateurs à des niveaux restant très élevés en S03.

 Abstract |  Full-Text |  Figures & Tables |  References (9) |  Supplementary Material |  Metrics/Cited By

Real-time PCR is one of the most widely used techniques to diagnose measles cases. Here we report measles virus variants with three genetic mutations in the reverse primer annealing site of a widely used PCR. The mutations result in a slight loss of the PCR sensitivity. Variants bearing the three mutations presently circulate in different countries since at least the end of 2021. Our findings highlight the usefulness of molecular surveillance in monitoring if oligonucleotides in diagnostic tests remain adequate.

# Encéphalite à tique, Europe

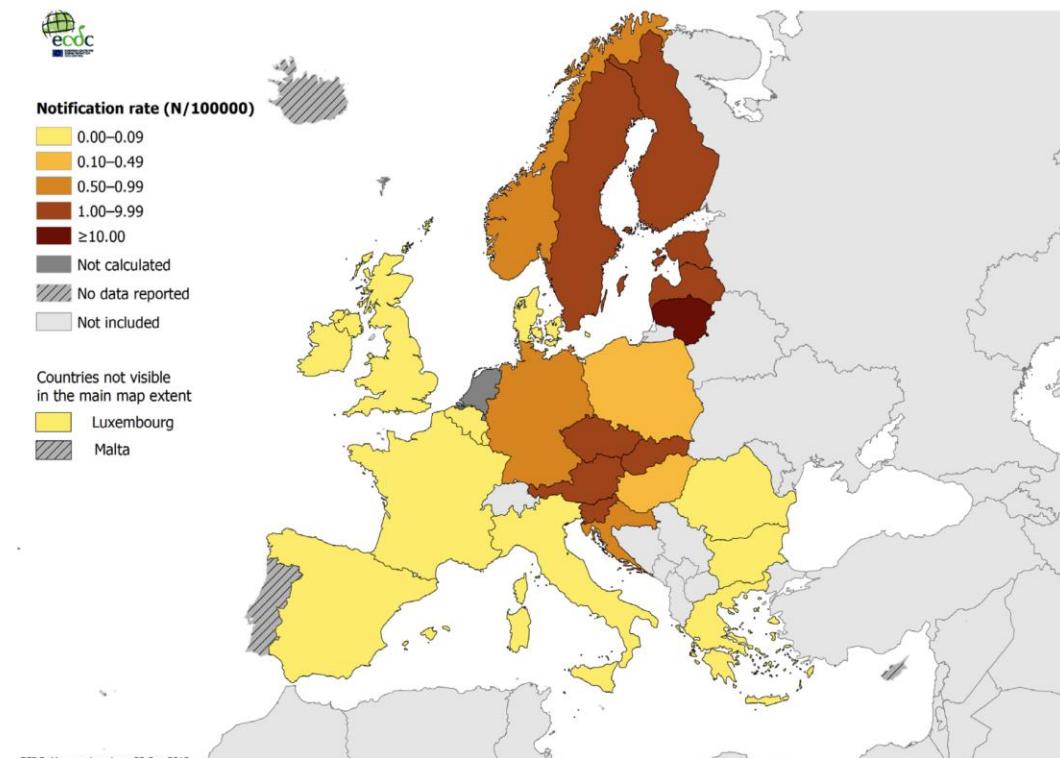

**Pologne:** Bilan 2023 : 659 cas

**UK:** Doctors record first-ever case of deadly tick-borne virus in the UK. A mountain biker riding through North Yorkshire Moors National Park in 2022 became the first confirmed person in the U.K. to contract encephalitis after getting bit by at least one black-legged tick. The man began experiencing fatigue, muscle pain, and fever after 5 days but eventually regained some health. However, he began to lose coordination about a week later, and an MRI scan showed that he had developed encephalitis..

**Estonie:** According to the Health Board, this year [2024] the first case of tick-borne encephalitis was registered in Saaremaa [Saare County]. According to the [Estonian] Department of Health, the number of tick-borne encephalitis cases has almost tripled over the past 3 years.

**Russie:** The 1st case of tick-borne encephalitis was detected in the Pskov region.

# Hépatites, Europe

## Hépatite A, Portugal

23 cases between 1 Jan and 5 Mar 2024. The majority of cases are men aged between 20 and 49 years old, 44% in the context of sexual transmission, with no serious or fatal cases reported

## Hépatite E, Finlande

In recent weeks, Finland has been surprised by the record high number of hepatitis E infections. According to the infectious disease register of the Institute of Health and Welfare, a total of 99 laboratory-confirmed infections have been recorded in 2024 from the beginning of January until 15 Mar 2024. At the same time in 2023, only 3 cases were recorded, and in recent years, an average of 30 infections have been detected per year.

# Intoxications alimentaires, Europe

## Salmonelle, UK et Finlande

Multi-country outbreak of *Salmonella* Mbandaka ST413 linked to consumption of chicken meat products in the EU/EEA and the UK. The shelf lives of contaminated frozen chicken meat products expired in November and December 2023. The most recent cases were detected in Finland in October 2023 and in the UK in February 2024.

## EHEC 0157, UK

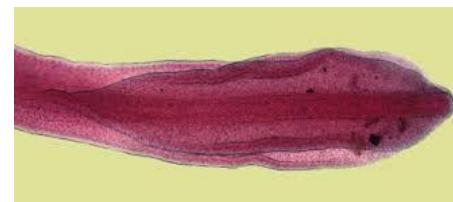

Officials in the UK are looking into an *E. coli* outbreak linked to chili sticks that has affected 5 people. Période de Noël 2023.

## Botulisme, Russie

Two cases of botulism registered in Irkutsk after eating converted [processed] mushrooms

## Diphyllobothriase (ténia du poisson), Russie

66 résidents du territoire de Krasnoïarsk ont contracté la diphyllobothriase, une infection due au ver solitaire, en 2023.

## Influenza A (H1N1), Espagne

### **1 cas humain de grippe H1N1 variant en Catalogne en Janvier 2024, pas d'autres cas rapportés**

On 29 January 2024, the Spanish health authorities notified the World Health Organization (WHO) of a laboratory confirmed human case of infection with swine-origin influenza A(H1N1) variant (v) virus, in the province of Lleida (Cataluña autonomous community), Spain. Including the current case, three cases of human infection with influenza A(H1N1)v virus have been reported in Spain. The first case was reported in 2008 and the second case was reported in January 2023. Based on the currently available information, no ongoing community transmission has been identified in this case. Thus, the risk of international disease spread through humans and/or community-level spread among humans is low.

[Go to section...](#)

Here we report a neonate in the Netherlands hospitalised for treatment of a community-acquired meningitis caused by *Elizabethkingia anophelis*. Analysis by core genome multilocus sequence typing (cgMLST) based on the core genome sequence of the *E. anophelis* strain isolated from cerebrospinal fluid (CSF) showed that it was clonally related to samples of the water reservoir of an automated infant milk dispenser that the family had used at home. This household appliance contains reservoirs for both water and infant formula, to automatically prepare a warmed milk bottle for infants.

We wish to raise awareness about a possible emergence of this pathogen in the community. This bacterium has already caused outbreaks of severe, difficult-to-treat infections in other parts of the world [1,2].

# La Réunion - Mayotte

## Leptospirose, La Réunion

Depuis janvier 2024, **119** cas de leptospirose ont été signalés (il s'agit d'un nombre de cas particulièrement élevé par rapport aux deux années précédentes à la même période) et 1 décès a été identifié (un autre décès est en cours d'investigation) (1 à 3 décès sont enregistrés par an à La Réunion).

La répartition des cas est la suivante : Sud (59%), Ouest (20%), Est (16%), Nord (5%). On constate une diminution du nombre de cas dans le sud de l'île et une augmentation du nombre de cas dans l'est.

Les patients sont essentiellement des hommes (96%) chez qui les hypothèses de contamination sont les activités agricoles et d'élevage (professionnelles ou de loisirs) et, dans une moindre mesure, les activités de loisirs en contact avec de l'eau douce et les activités de nettoyage de cours.

Measles Travel Health Notice

## Hépatite B, Arabie Saoudite

**Augmentation des cas d'hépatite B potentiellement liés au pèlerinage à la Mecque et le recours à des soins dentaires, esthétiques, utilisation de drogues**

According to an internal medicine and infectious diseases physician Dr. Nizar Bahbari, the rise of hepatitis B infection in Makkah and Jeddah areas, which, according to Saudi Ministry of Health statistics, reached 938 cases in Jeddah and 648 cases in Makkah in 2022, could be attributed to Hajji foreigners who prefer to stay after Hajj and Umrah seasons, plus other unsafe practices of dental care, beauty salons, and drugs.

# Kyasanur Forest Disease, Inde

- Kyasanur Forest Disease (KFD) is a zoonotic disease which was first reported in India in 1957. It is caused by a flavivirus, transmitted to humans (who are the incidental host) by ticks, with birds and mammals forming part of the sylvatic lifecycle.<sup>1</sup>
- In humans, symptoms including fever and headache, and can cause hemorrhagic manifestations in some cases. The case fatality rate (CFR) is estimated to be between 3 and 5%.<sup>2</sup>
- In India, the disease is endemic in Shimoga and its neighboring districts in Karnataka state; however, between 2012 and 2014, outbreaks were reported in Chamarajanagar district, Karnataka and the neighboring Malappuram and Wayanad districts of Kerala state and in 2015 and 2016, outbreaks were reported in the state of Goa.<sup>1</sup>
- Outbreaks are seasonal, occurring from December to May, corresponding with the maximum density of the nymphal stages of the ticks.<sup>1</sup> Between 2011 and 2019, approximately 400 to 500 cases are reported yearly.

**85 cas au 11 Février 2024 dans l'état du Karnataka, versus 19 sur tout 2023. Diminution de l'incidence courant Février.**

# Herpès simien, Chine

## 1er cas d'Herpès simien dans la région de Hong Kong

**Hong Kong.** The Centre for Health Protection today said it recorded the **first** human case of B virus, also known as the herpes simiae virus, and urged the public to refrain from touching or feeding wild monkeys to minimise the risk of contracting the virus. The centre is investigating the case, which involves a 37-year-old man with good past health, who had contact with wild monkeys and was wounded by them during a visit to **Kam Shan Country Park** in late February [2024]. The man was admitted to Yan Chai Hospital through the accident and emergency department on 21 Mar 2024 with a fever and decreased conscious level. He is receiving treatment at the hospital's intensive care unit and is in a critical condition.

## Nipah virus, Bangladesh

Depuis le 1er janvier et jusqu'au 9 février 2024, **deux** cas de NiV confirmés en laboratoire ont été signalés dans la division de Dhaka au Bangladesh. Les deux cas sont décédés.
