Bezlotoxumab for Prevention of Recurrent Clostridium difficile Infection

ICD traitement

Randomised, controlled, open-label study comparing the efficacy of extended-pulsed fidaxomicin (EPFX) with vancomycin therapy for sustained clinical cure of *Clostridium difficile* infection in an older population: the EXTEND study

Benoit Guery,¹ Francesco Menichetti,² Simon Goldenberg,³ Karen Bisnauthsing,³ Jose Maria Aguado,⁴ Veli-Jukka Anttila,⁵ Chris Longshaw,⁶ Gbenga Kazeem,⁶ Andreas Karas,⁶ Nicholas Adomakoh,⁶ Oliver A. Cornely,^{7,8} Maria Vehreschild⁸

ECCMID 2017 EP0363

Patients were randomised (1:1) to receive:

- EPFX: fidaxomicin 200 mg oral tablets, twice daily on Days 1–5, then once daily on alternate days from Days 7–25,

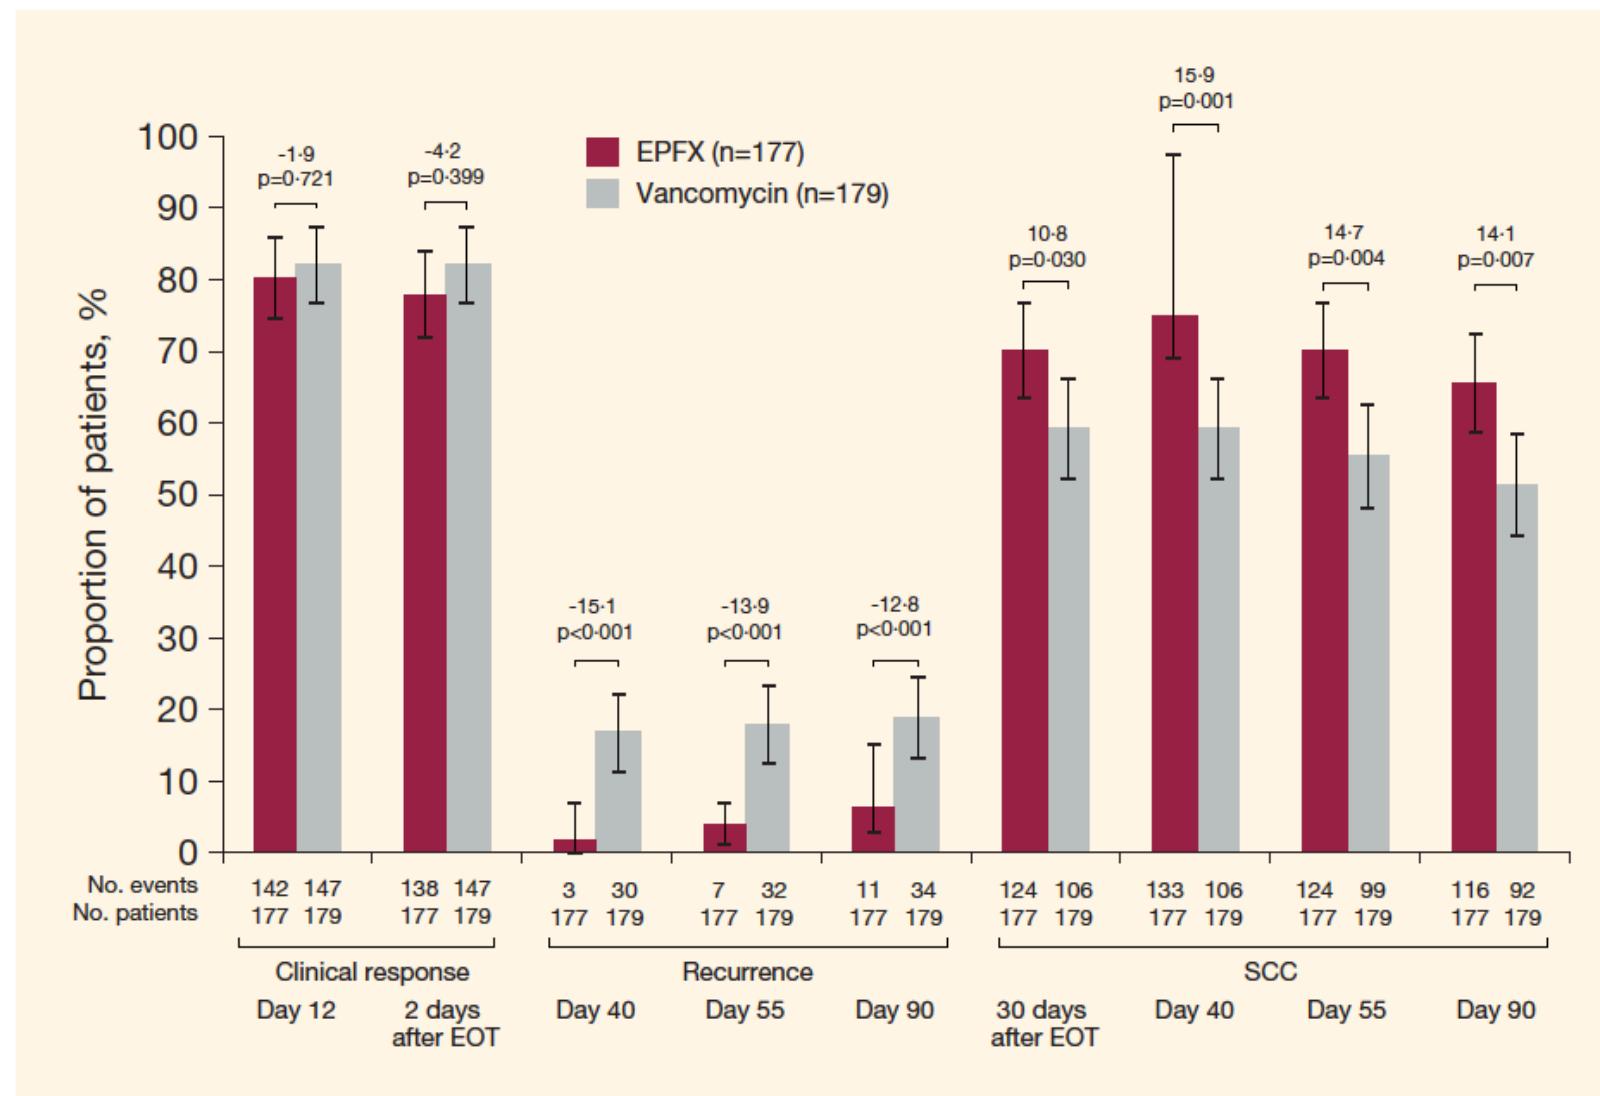

Dose totale de fidaxomicine identique à celle du schéma classique

or

- Vancomycin: 125 mg oral capsules, four-times daily on Days 1–10

Figure 2. Clinical response at Day 12 and 2 days after end of treatment, CDI recurrence and sustained clinical cure of CDI at 30 days after end of treatment (primary endpoint), and Days 40, 55 and 90 (mFAS)

B. Guery et al
ECCMID 2017 EP0363

Bars show 95% CI. EOT, end of treatment; EPFX, extended-pulsed fidaxomicin; mFAS, modified Full Analysis Set; SCC, sustained clinical cure of CDI

Table 1. Demographics and baseline characteristics, mFAS

Characteristic	EPFX (n=177)	Vancomycin (n=179)	Total (N=356)
Sex, n (%)			
Female	107 (61)	100 (56)	207 (58)
Race, n (%)*			
White	149 (84)	153 (85)	302 (85)
Missing	28 (16)	26 (15)	54 (15)
Median (range) age, years	75 (60–94)	75 (60–95)	75 (60–95)
UBMs per day, n			
Mean (SD)	6.8 (4.7)	6.4 (3.4)	6.6 (4.1)
Median	5.0	5.0	5.0
Severe CDI (ESCMID score), n (%)	78 (44)	84 (47)	162 (46)
Recurrences in past 3 months, n (%)			
0	141 (79.7)	140 (78.2)	281 (78.9)
1	26 (14.7)	29 (16.2)	55 (15.4)
2	10 (5.6)	10 (5.6)	20 (5.6)

Duodenal Infusion of Donor Feces for Recurrent
Clostridium difficile

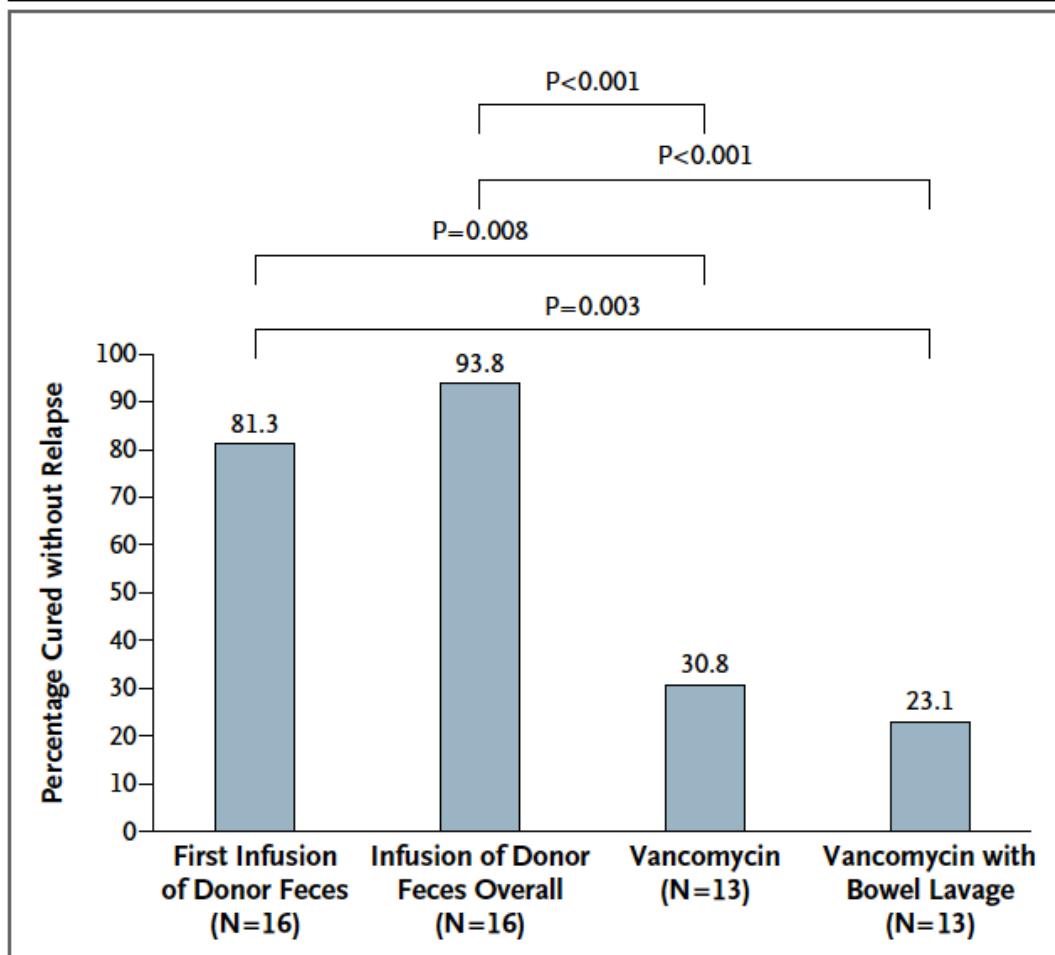

Figure 2. Rates of Cure without Relapse for Recurrent *Clostridium difficile* Infection.

Shown are the proportions of patients who were cured by the infusion of donor feces (first infusion and overall results), by standard vancomycin therapy, and by standard vancomycin therapy plus bowel lavage.

FMT par lavement

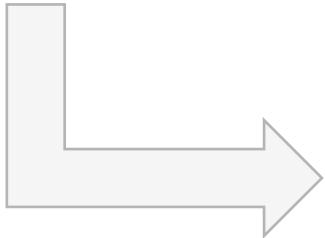

Table 3. Primary Efficacy Outcome in the Modified Intention-to-Treat and Per-Protocol Populations According to Subgroup at 13 Weeks
After Last Fecal Microbiota Transplantation

	mITT			Per-Protocol		
	Proportion With Clinical Resolution, No./Total (%)		Difference (95% CI), %	Proportion With Clinical Resolution, No./Total (%)		Difference (95% CI), %
	Frozen	Fresh		Frozen	Fresh	
Overall Population						
Primary efficacy outcome ^a	81/108 (75.0)	78/111 (70.3)	4.7 (-5.2 to ∞) ($P < .001$)	76/91 (83.5)	74/87 (85.1)	-1.6 (-10.5 to ∞) ($P = .01$)
Subgroups						
Age, y						
<65	22/27 (81.5)	17/27 (63.0)	18.5 (-1.1 to ∞)	21/24 (87.5)	17/21 (81.0)	6.5 (-11.4 to ∞)
≥65	59/81 (72.8)	61/84 (72.6)	0.2 (-11.2 to ∞)	55/67 (82.1)	57/66 (86.4)	-4.3 (-14.7 to ∞)

ICD sujet âgé

Plus de récidives

Plus à risque de gravité

Pas de métronidazole

Avoir la fidaxomicine facile y compris au premier épisode d'ICD

Envisager sa modalité d'administration extended-pulse

FMT aussi efficace après 65 ans

Bezlotoxumab à voir selon son prix
