Plan

- Antibiotiques intracellulaires
- Principes de traitement des infections intracellulaires: *C. burnetii, Bartonella spp, Rickettsia spp, S. aureus*!

Plan

- Antibiotiques intracellulaires
- Principes de traitement des infections intracellulaires: *C. burnetii, Bartonella spp, Rickettsia spp, S. aureus*!

Action intracellulaire des antibiotiques?

- Traitement des infections à bactéries intracellulaires strictes (obligatoires): *Coxiella burnetii, Rickettsia spp , Chlamydia spp, Ehrlichia spp, Anaplasma spp, Tropheryma whipplei, Mycobacterium spp*
- Traitement des infections à bactéries intracellulaires facultatives:
  - Les vraies: *Legionella spp, Mycoplasma spp, Bartonella spp, Francisella tularensis, Listeria monocytogenes, Samonella spp, Yersinia spp, Brucella*
  - Les « occasionnelles »: *Staphylococcus aureus, Pseudomonas aeruginosa, Escherichia coli, Streptococcus pyogenes*

Cellules cibles

Souvent des macrophages… mais pas que

Main disease-causing intracellular bacteria and their preferential target cells.

Bacterial pathogen	Associated disease(s)	Target cells	Reference(s)
Mycobacterium tuberculosis	Tuberculosis	Macrophages, hepatocytes	[13,14]
Mycobacterium avium complex	Pulmonary infections	Alveolar macrophages	[15]
Mycobacterium leprae	Leprosy	Macrophages, epithelial cells	[16]
Listeria monocytogenes	Listeriosis, meningitis, septicaemia	Macrophages, hepatocytes, enterocytes	[17,18]
Staphylococcus aureus	Pneumonia, mastitis, phlebitis, endocarditis, nosocomial infections, urinary tract infections, osteomyelitis	Macrophages, polymor-phonuclear neutrophils	[19]
Salmonella spp.	Salmonellosis, typhoid fever	Macrophages, enterocytes	[20,21]
Brucella spp.	Brucellosis	Macrophages	[22]
Yesinia pestis	Plague	Macrophages	[23]
Escherichia coli	Diarrhoeal illness, urinary tract infections, meningitis in neonates	Epithelial cells, macrophages	[24,25]
Pseudomonas aeruginosa	Pneumonia, endocarditis, meningitis, nosocomial infection	Macrophages, epithelial cells	[26,27]
Legionella pneumophila	Pneumonia	Macrophages	[28]

N Abed et al., IJAA 2014; 43: 485–496

Cellules cibles

- Les cellules cibles sont variables selon l'infection:
  - **Hématies:** *Bartonella spp*
  - **Monocytes-Macrophages:** *C. burnetii, Ehrlichia spp, L. monyctogenes, Legionella spp, Brucella spp, F. tularensis, Yersinia, Salmonella, S. aureus, Mycobacterium tuberculosis….*
  - **Cellules endothéliales***: Rickettsia spp., Bartonella spp.,*
  - **Cellules épithéliales**: *Chlamydia spp, S. aureus, E. coli*
  - **Ostéoblastes:** *S. aureus….*

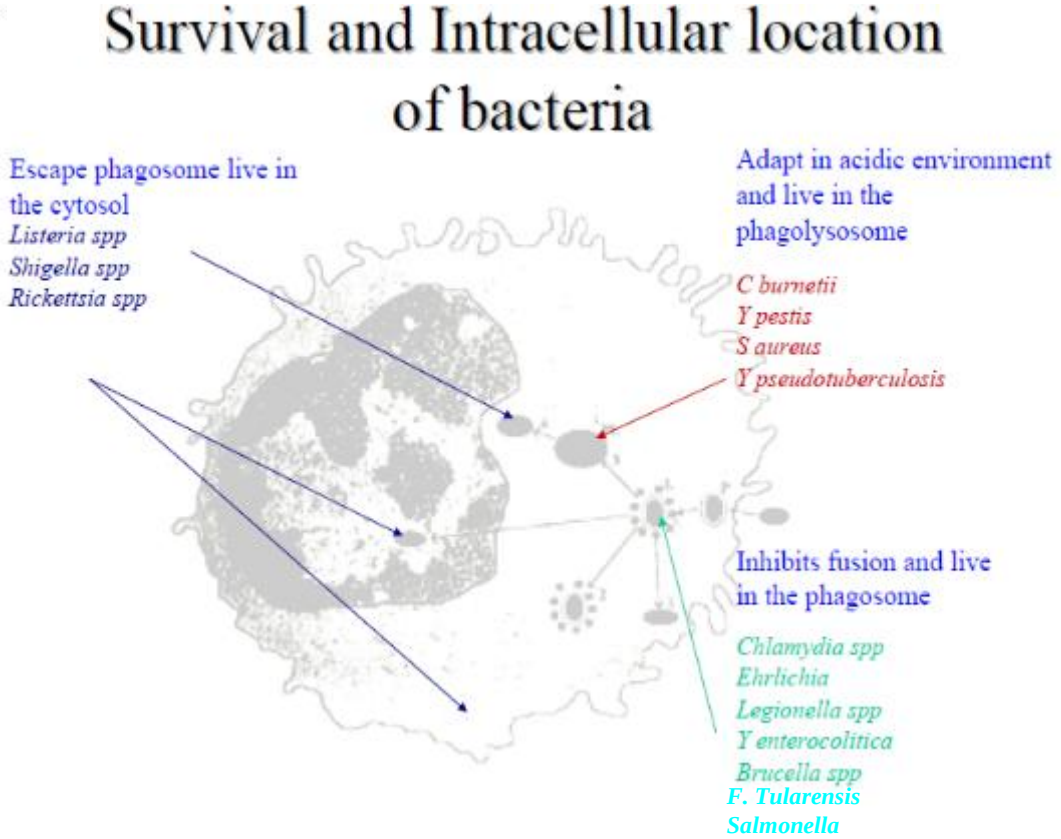
Table 1
Main intracellular bacteria with predominant target cells in humans and known subcellular localization of virulent forms

Organism	Type of parasite	Target cells	Subcellular localization	References
Brucella spp	Facultative	Macrophages	Phagosomes	[99]
Chlamydia spp	Obligate	Lung parenchyma cells	Inclusions	[100]
Coxiella burnetii	Obligate	Macrophages, lung parenchyma cells	Phagosomes, phagolysosomes	[101,102]
Francisella tularensis	Facultative	Macrophages	Phagosomes	[103]
Legionella pneumophila	Facultative	Macrophages	Endoplasmic reticulum, lysosomes	[102,104]
Listeria monocytogenes	Facultative	Macrophages, hepatocytes	Cytosol	[4]
Mycobacterium tuberculosis	Facultative	Macrophages	Early endosomes	[105]
Rickettsia spp	Obligate	Endothelial cells	Cytosol	[106]
Salmonella spp	Facultative	Macrophages	Phagosomes	[107]
Shigella flexeneri	Facultative	Macrophages	Cytosol	[108]
Staphylococcus aureus	Opportunist	Macrophages, PMNs	Phagolysosomes	[109–111]

Cibles cellulaires



Les bactéries vont se localiser dans des compartiments cellulaires différents

D'après P. Brouqui,
S. Carryn et al / Infect Dis Clin N Am 17 (2003) 615–634

« Pour vivre heureux, vivons cachés »

- Localisation intracellulaire:
  - évasion immune, protège la bactérie du système immunitaire
  - «Réservoir », infection chronique, rechutes
  - va permettre la dissémination de la bactérie dans les tissus, à distance (PNN, macrophages): «Cheval de Troie »
  - Protège de l'action des ATB

Thwaites GE, et al., Nat Rev Microbiol. 2011 Mar;9(3):215-22

Challenges des antibiotiques en intracellulaire

I. **Pénétration** de l'ATB en intracellulaire (phagocytes professionnels ou non professionnels)

Tulkens PM. Eur J Clin Microbiol Infect Dis. 1991 10:100-6
Butts JD, Clin . Pharmocokinet. 27 (1): 63-84.1994

Entrée dans la cellule

- Les molécules de petite taille (< 700 Da), lipophiles telles que les β lactamines, macrolides et quinolones rentrent par diffusion à travers la membrane lipidique
- L'entrée peut se faire par endocytose si la molécule est plus grande ou ne peut pas diffuser.
- L'endocytose nécessite une internalisation avec des vésicules à la membranes et une invagination de celle-ci. Les vésicules sont se diriger vers l'endosome. (Ex: aminosides, via la megaline (recepteur sur endosomes notamment au niveau tubule renal: d'où possible toxicité)
- **Une fois dans la cellule les ATB doivent être retenus et s'accumuler à une concentration suffisante pendant une période suffisante.**
- Des pompes à efflux vont pouvoir faire sortir les ATB (ex macrolides ou FQ)

- En fonction un ATB peut être bactéricide ou pas en intracellulaire (ex: tigecycline= bactériostatique sur *S. aureus* en intracellulaire et bactéricide sur Salmonella)

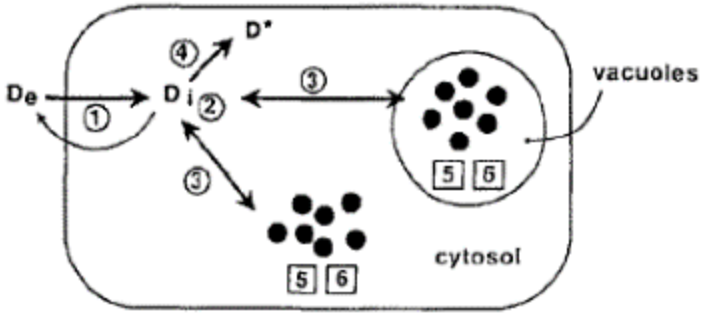
Challenges des antibiotiques en intracellulaire

I. **Pénétration** de l'ATB en intracellulaire (phagocytes professionnels ou non professionnels)
II. **Stabilité/ Maintien** de l'ATB dans le compartiment intracellulaire

III. **Hautes concentrations** d'ATB dans le compartiment intracellulaire
IV. **Bonne localisation**, au contact du pathogène dans la cellule (être dans le bon compartiment)
V. **Etre actif** sur bactérie en phase de multiplication et quiescente (ex: SCV *S. aureus* etc…)

Tulkens PM. Eur J Clin Microbiol Infect Dis. 1991 10:100-6
Butts JD, Clin . Pharmocokinet. 27 (1): 63-84.1994

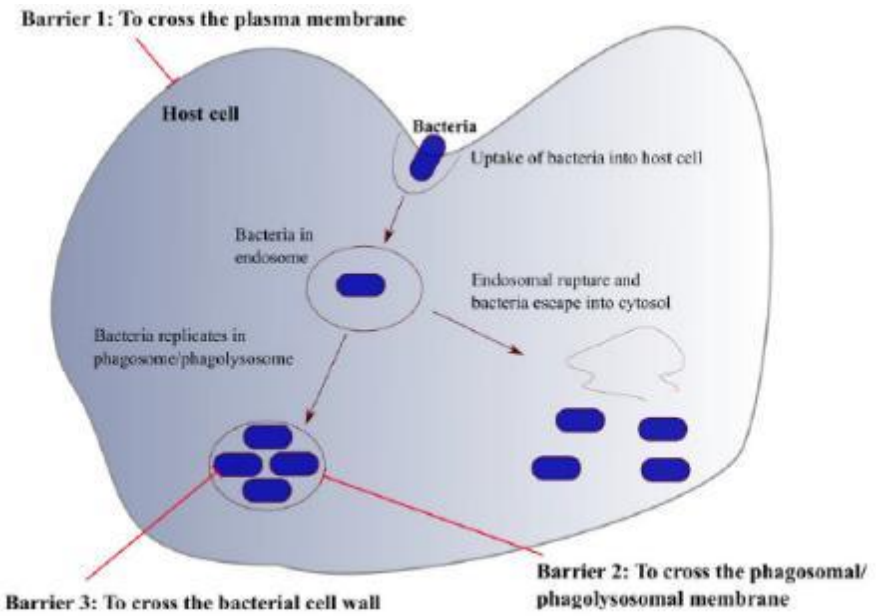
FACTORS AFFECTING THE ACTIVITY OF ANTIMICROBIALS AGAINST INTRACELLULAR BACTERIA



De = extracellular drug
Di = intracellular drug
D* = metabolites
● = bacteria

Pharmacokinetic parameters	Pharmacodynamic parameters
① Penetration and retention	5 Expression of activity
② Accumulation	6 Bacterial responsiveness
③ Subcellular disposition and bioavailability	
④ Melabolisation and inactivation	

Figure 1: Pharmacokinetic and pharmacodynamic parameters involved in the activity of antimicrobial drugs against intracellular microorganisms.



Tulkens PM. Eur J Clin Microbiol Infect Dis. 1991 10:100-6.

Challenges des antibiotiques en intracellulaire

VI. Certaines bactéries sont intracellulaires « facultatives » voire « opportunistes »: survie intra ET extracellulaire

- Donc ATB doivent **aussi** avoir une activité extracellulaire (concentrations)

Butts JD, Clin . Pharmocokinet. 27 (1): 63-84.1994

Table IV. Predictive activity of an antibacterial agent against *Staphylococcus aureus* on the basis of the intracellular and extracellular concentration to minimum inhibitory concentration (MIC) ratios after the addition of 1 and 4 times the minimum bactericidal concentration of the drug to the culture

Antibacterial agent	Intracellular concentration (IC) [mg/L] [a]	MIC (mg/L)[b]	IC : MIC ratio	Extracellular concentration (EC) [mg/L][a]	EC : MIC ratio
Azithromycin	0.42	0.25	1.68	Not detected	0
	1.78		7.12	0.23	0.92
Azithromycin	0.42	1.0	0.42	Not detected	0
	1.78		1.78	0.23	0.23
Azithromycin ratio range			**0.42-7.12**		**0-0.92**
Clarithromycin	0.34	0.12	2.83	0.15	1.93
	1.33		11.08	0.66	5.50
Clarithromycin	0.34	0.50	0.68	0.15	0.30
	1.33		2.66	0.66	1.32
Clarithromycin ratio range			**0.68-11.08**		**0.30-5.50**

a Data from Scaglione et al.[25] represent the resulting concentrations after addition of 1- and 4-times the minimum bactericidal concentration of drug.

b MIC data from the National Committee for Clinical Laboratory Standards.[17] The upper and lower limit of the range for MIC inhibitory to 90% of organisms were used to determine the intracellular and extracellular concentration to MIC ratios.

<1

Ratios intra/extracellulaire

- Variables selon les antibiotiques/ même famille
- Variables selon le compartiment cellulaire
- Variables selon le pH
- Variables selon la T°
- Variables selon que la cellule est ou non infectée

REVIEW ARTICLE

Targeting the hard to reach: challenges and novel strategies in the treatment of intracellular bacterial infections

Fig. 1. Intracellular delivery of antibiotics to treat intracellular infections. Following cell internalisation through one or several endocytic pathways, nanocarriers should be destabilised and/or degraded by hydrolytic enzymes and/or acidic pH to allow the antibiotic to be released. A diffusible antibiotic will easily escape from endosomes and reach cytoplasmic bacteria (a) or vesicles containing bacteria (b) to exert antimicrobial activity. In some cases, fusion between endosomes (with captured nanocarriers + antibiotic) and vesicles containing bacteria (c) are needed in order to allow non-diffusible antibiotics to exert their antimicrobial activity.

Diagnostic de ces infections

- Indirect++
- Direct:
  - Culture: rare
  - Biologie moléculaire+++

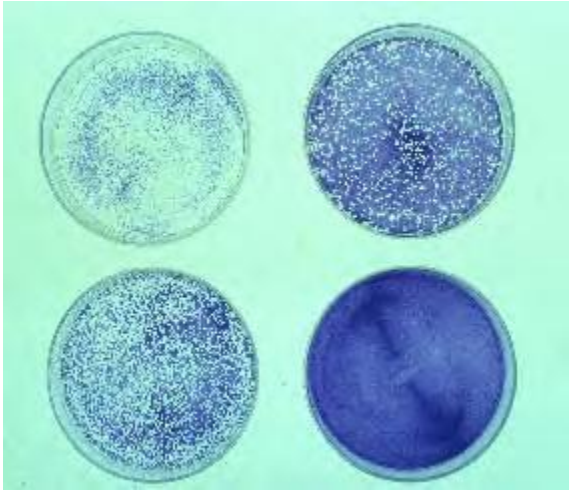
Tableau I. Approche diagnostique de certaines bactéries intracellulaires abordées dans cette revue
[1] Les anticorps de phase II (IgG ≥ 1 : 200 UI/ml; IgM ≥ 1 : 50 UI/ml) définissent la fièvre Q aiguë, les anticorps de phase I (IgG ≥ 1 : 800 UI/ml) définissent la fièvre Q chronique. TB: tuberculose.

Bactérie	Culture	Sérologie	PCR	Autres
M. tuberculosis et autres mycobactéries	• Recommandée dans tous les cas (test de référence) • Indispensable pour la détermination du profil de sensibilité antibiotique	Non disponible	Test commercialisé pour *M. tuberculosis*. Très utile pour le diagnostic précoce (TB pulmonaire ou méningite) en complément de l'examen direct	• Examen direct: très utile pour le diagnostic précoce, mais sensibilité limitée • Interferon-γ release assays (QuantiFERON-TB, T-SPOT.TB): non recommandé pour la TB active (TB latente uniquement)
Legionella spp.	• Recommandée pour la pneumonie (milieu spécial) • Très faible rendement dans les échantillons non respiratoires (hémocultures notamment)	• Peu utile pour la forme classique (pneumonie) • A considérer pour des formes atypiques (endocardite)	Utile (si disponible) en complément de la culture sur les échantillons respiratoires ou autres	• Antigène urinaire: recommandé (ne remplace cependant pas la culture, sensibilité limitée, détecte uniquement *L. pneumophila* sérogroupe 1) • Immunofluorescence directe: peu utile (peu sensible)
Chlamydia pneumoniae	Non effectuée de routine	Peu utile en raison du délai pour le diagnostic	Test de choix (rapide et sensible)	–
Mycoplasma pneumoniae	Non effectuée de routine	Peu utile en raison du délai pour le diagnostic	Test de choix (rapide et sensible)	–
Coxiella burnetii	Non effectuée de routine	• Recommandée (à répéter à un intervalle de 14 jours si négatif)[1] • Aussi utile pour le suivi	Utile, en complément de la sérologie	–
Bartonella spp.	• Test de référence pour la bactériémie chronique (*B. quintana*) • Peu utile dans les autres cas (peu sensible, incubation prolongée)	Test de référence. Bonne sensibilité pour la maladie des griffes du chat et l'endocardite	Utile, en complément de la sérologie (endocardite notamment)	–
Tropheryma whipplei	Non effectuée de routine	Non disponible (taux d'anticorps faibles ou absents)	Recommandée. Sur échantillons de selles et salive (± biopsie cutanée et autres sites selon la présentation clinique)	• Histopathologie (coloration PAS): pour la forme digestive classique • Immunohistochimie: sur échantillons ciblés

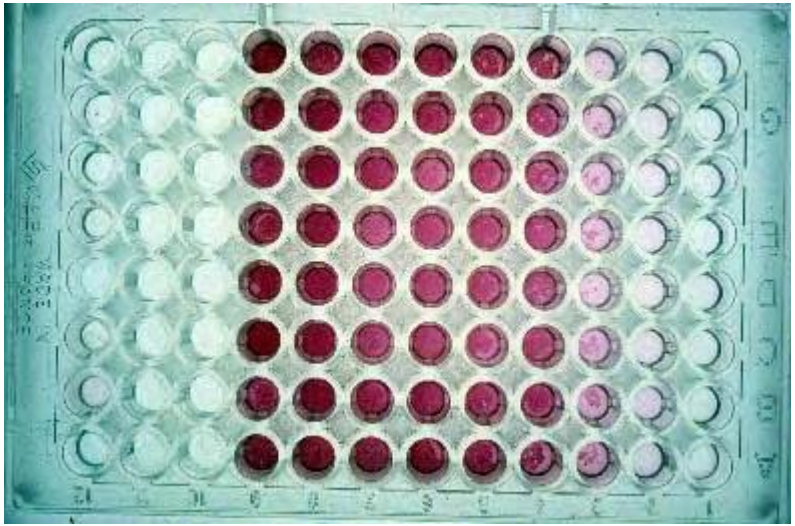
Etude de la sensibilité aux « ATB » en intracellulaire

- Complexe
- Fait souvent appel à la culture cellulaire
- Pas en routine
- « time consumming »
- Techniques ATBgramme différentes

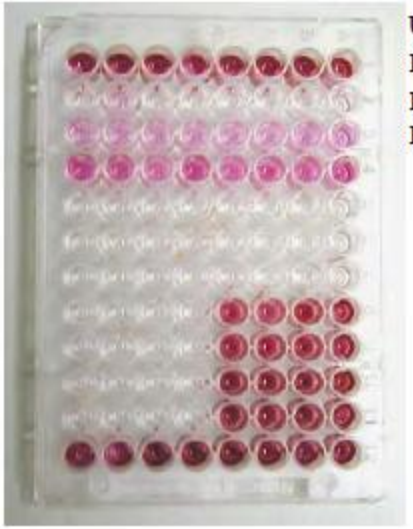
Bactéries intracellulaires strictes



Plaque assay



Dye uptake assay



Uninfected cells OD = 1

Infected cells 2000 PFU OD = 0

Infected cells 200 PFU OD = 0.150

Infected cells 20 PFU OD = 0.700

•The optical density at 492 nm of each well is determined using a spectrophotometer

The MIC corresponds to the lowest antibiotic concentration for which the mean OD at 492 nm is higher than that of the 20 PFU controls

Doxycycline 0.015 µg/ml OD =0

Doxycycline 0.03 µg/ml OD = 0

Doxycycline 0.06 µg/ml OD = 0

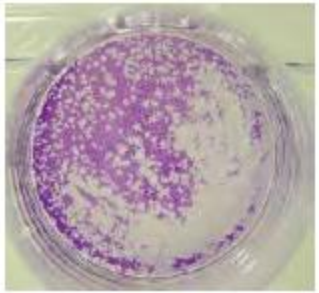
Doxycycline 0.125 µg/ml OD =0.89 MIC

Doxycycline 0.25 µg/ml OD = 0.95

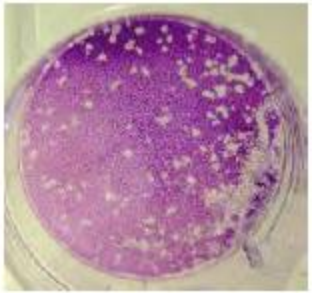
Doxycycline 0.5 µg/ml OD =1

Doxycycline 1 µg/ml OD = 1

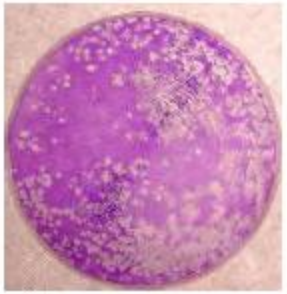
Doxycycline 0.015 µg/ml



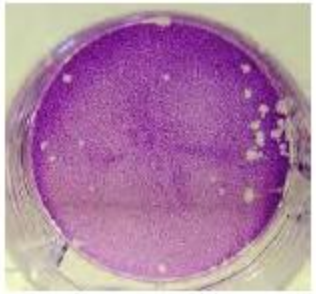
Doxycycline 0.03 µg/ml



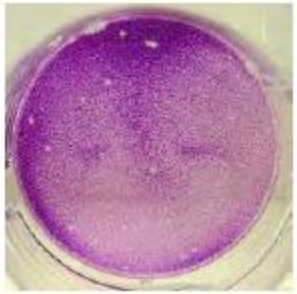
Doxycycline 0.06 µg/ml



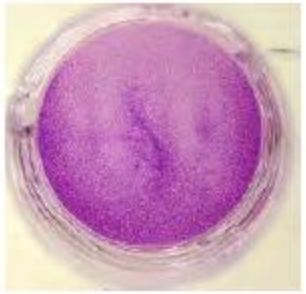
Doxycycline 0.125 µg/ml



Doxycycline 0.25 µg/ml



Doxycycline 0.5 µg/ml



The MICs are defined as the lowest antibiotic concentration allowing complete inhibition of plaque formation, as compared to a drug-free control

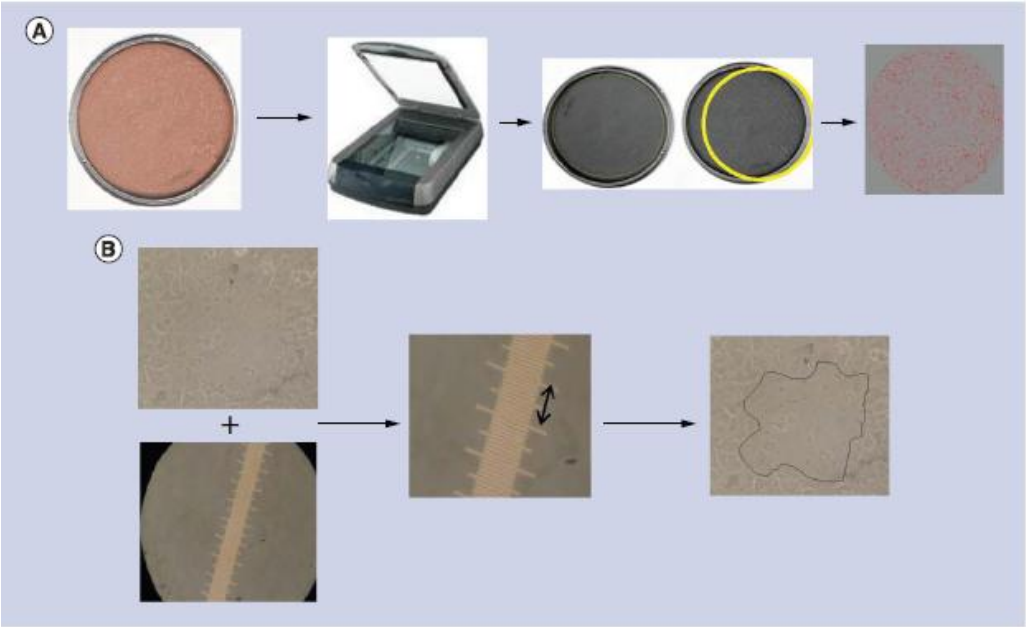


Figure 3. Two examples of informatics tools recently developed to measure the number and/or the size of the lytic plaque. (A) To study the effect of statins on *Rickettsia conorii*-infected cells, an image of the Petri dish was acquired with a photo scanner after staining with crystal violet, and the images were analyzed with the Image J software (MD, USA) using the 'local threshold' algorithm. This software counts and evaluates the size of the plaques in each Petri dish [7]. **(B)** To study the deleterious effects of antibiotics on *R. conorii*-infected cells, the lytic area was measured with the Image J software to more precisely determine the area of each individual lytic plaque (mm^2) by tracing the outline of each plaque [8,10]. The arrow in the centre image shows determination of the scale bar (number of pixels/mm).

Fig. 1 Schematic representation of potential drivers of *Coxiella burnetii* spatial dispersal from livestock holdings. Green shading indicates potential human transmission pathways. The top section of the figure demonstrates how airborne dispersal and environmental contamination are proposed to contribute to the zoonotic exposure of human communities. This dispersal can be influenced over a range of spatial distances by factors represented in the bottom section of the figure

General review

Q fever in the Netherlands – 2007–2010: What we learned from the largest outbreak ever

Fièvre Q aux Pays-Bas – 2007–2010 : les enseignements d'une épidémie d'une ampleur sans précédent

P.M. Schneeberger[a], C. Wintenberger[b,*], W. van der Hoek[c], J.P. Stahl[b]

Fever was the most frequent symptom, in more than 90% of notified cases. The other reported symptoms were: flu-like syndrome with malaise and headaches in 63 to 92% of cases, coughing in 66% of cases, nocturnal hyperhidrosis in 80% of cases. Pneumonia concerned 66% of notified cases, hepatic presentations were more rare (15%) than in previous outbreaks, especially compared to the French outbreak in Chamonix [4,9,15,23]. The male/female ratio of notified cases in 2007 and 2008 was 1.7/1, with an average age of 51 years [9].

TABLE 2 The Dutch consensus guidelines criteria for chronic Q fever[a]

Category and criterion (criteria)[b]
Proven chronic Q fever
Positive *C. burnetii* PCR in blood or tissue **or**
IFA titer of ≥1:1,024 for *C. burnetii* phase I IgG **and**
Definite endocarditis according to the modified Duke criteria **or**
Proven large-vessel or prosthetic infection by imaging studies (18 F-FDG PET, CT, MRI, or AUS)
Probable chronic Q fever
IFA titer of ≥1:1,024 for *C. burnetii* phase I IgG **and** one or more of the following criteria:
Valvulopathy not meeting the major criteria of the modified Duke criteria
Known aneurysm and/or vascular or cardiac valve prosthesis without signs of infection by means of TEE/TTE, 18 F-FDG PET, CT, MRI, or abdominal Doppler ultrasound
Suspected osteomyelitis or hepatitis as manifestation of chronic Q fever
Pregnancy
Symptoms and signs of chronic infection such as fever, wt loss, and night sweats, hepatosplenomegaly, persistent elevated ESR and CRP
Granulomatous tissue inflammation, proven by histological examination
Immunocompromised state
Possible chronic Q fever
IFA titer of ≥1:1,024 for *C. burnetii* phase I IgG without manifestations meeting the criteria for proven or probable chronic Q fever

Commentary

Treatment of *Coxiella burnetii* endocarditis with hydroxychloroquine. Is it evidence-based?

J.P. Stahl [1], E. Varon [2], J.P. Bru [3]

Comparison of outcome between two therapeutic regimens

	Doxycycline + ofloxacin ($n = 14$)	Doxycycline + hydroxychloroquine ($n = 21$)	p-value
Deaths, *n*	1	1	0.77
Valvular surgery, *n*	10	10	0.16
Relapses after completed treatment, *n*	7 of 15	2 of 23	0.01
Relapses after 18 mo of treatment, *n*	6 of 11	0 of 16	0.001
Mean treatment duration among cured patients (mo)	55 ± 18	31 ± 14	<0.001
Photosensibilization, *n*	14	21	NA

Treatment of Chronic Q Fever: Clinical Efficacy and Toxicity of Antibiotic Regimens

Sonja E. van Roeden,[1] Chantal P. Bleeker-Rovers,[2] Marieke J. A. de Regt,[1] Linda M. Kampschreur,[3] Andy I. M. Hoepelman,[1] Peter C. Wever,[4] and Jan Jelrik Oosterheert[1]

Table 3. Number of Events and (Subdistribution) Hazard Ratios for Primary and Secondary Outcomes

Endpoint/Treatment Strategy	Number of Events	HR	95% Confidence Interval	*P* Value
All-cause mortality[a]		HR		
Reference: TET/HCQ	30	1.00	n/a	n/a
TET/QNL	5	1.07	0.37–3.14	.90
TET/QNL/HCQ	3	2.19	0.73–6.56	.16
TET	3	0.70	0.21–2.36	.57
QNL	14	1.60	0.76–3.39	.22
First disease-related event[b]		SHR		
Reference: TET/HCQ	44	1.00	n/a	n/a
TET QNL	7	1.51	0.66–3.47	.33
TET/QNL/HCQ	2	0.94	0.22–3.96	.93
TET	7	1.27	0.53–3.06	.59
QNL	12	1.22	0.57–2.59	.61
Therapy failure[c]		SHR		
Reference: TET/HCQ	60	1.00	n/a	n/a
TET/QNL	7	0.93	0.39–2.19	.86
TET/QNL/HCQ	4	1.21	0.37–3.96	.75
TET	9	1.43	0.67–3.04	.35
QNL	15	1.26	0.68–2.35	.47

Conclusions. Treatment of chronic Q fever with TET plus QNL appears to be a safe alternative for TET plus HCQ, for example, if TET plus HCQ cannot be tolerated due to side effects. Treatment with TET plus QNL plus HCQ was not superior to treatment with TET plus HCQ, although this may be caused by confounding by indication. Treatment with TET or QNL monotherapy should be avoided; switches due to subjective, insufficient clinical response were frequently observed.

Etude rétrospective, peu de cas, traitements très hétérogènes en molécules, durées et sans puissance statistique pour conclure

- **Donc le débat n’est pas tranché:**

A ce stade, faible niveau de preuve pour HCQ+doxy dans les formes persistantes de fièvre Q

MAIS niveau de preuve concernant les alternatives tout aussi faible voire plus

- Pour conclure il faut un essai randomisé +/- contrôlé +++
- Forcement essai international vu la faible incidence de ces formes
- Difficile à mener car formes cliniques sont très hétérogènes, évolution lente
- Besoin d’études bien conduites, sans « passion » pour proposer le meilleur traitement au patient

Group	Disease	Regimen	Grade[a]	Adults	Children[b]	Pregnant women
SFG	Mediterranean spotted fever	Preferred	A I	Doxycycline 200 mg two oral doses in a single day	–	–
			A III	Doxycycline 200 mg single dose or 100 mg twice daily for 2–5 days	Doxycycline 2.2 mg/kg every 12 h for children weighing <100 lb (45 kg) or adult dosage if ≥100 lb, for 5–10 days	Josamycin 1 g every 8 h for 5 days (in severe form of Mediterranean spotted fever, single dose of doxycycline should be used)
		Alternatives	A I	Josamycin[c] 1 g every 8 h for 5 days	Josamycin 50 mg/kg every 12 h for 5 days	
			A I	–	Clarithromycin 15 mg/kg/day in 2 divided doses for 7 days	–
					Azithromycin 10 mg/kg/day in 1 dose for 3 days	–
			B II–D III	Ciprofloxacin	–	–
	Rocky Mountain spotted fever	Preferred	A III	Doxycycline 100 mg every 12 h for 5–10 days	Doxycycline 2.2 mg/kg every 12 h for children weighing <99 lb (45 kg), or adult dosage if ≥100 lb, for 5–10 days	Doxycycline 100 mg every 12 h for 5–10 days[b]
		Alternatives	A III	–	Chloramphenicol 12.5–25 mg/kg every 6 h for 5–10 days	–
	Other SFG rickettsioses	Preferred	A III	Doxycycline 200 mg single dose or 100 mg twice daily for 2–5 days	–	–
Typhus group	Murine typhus	Preferred	A III	Doxycycline 100 mg, twice daily, continued for 3 days after symptoms have resolved	Doxycycline 100–200 mg, for 3–7 days	Doxycycline (late trimester)
				Doxycycline 100–200 mg, single dose	–	–
		Alternatives	D III	Fluoroquinolones	–	Erythromycin
			D III	Chloramphenicol 60 to 75 mg/kg/day in four divided doses	Chloramphenicol	Chloramphenicol (early trimester: first and second trimesters)
	Epidemic typhus	Preferred	A II	Doxycycline 200 mg for 5 days, or 2–4 days after defervescence	–	–
			A III	Doxycycline 100–200 mg, single dose in outbreak situations	Doxycycline 100–200 mg, single dose	Doxycycline 100–200 mg, single dose
		Alternatives	D III	Chloramphenicol 60 to 75 mg/kg/day in four divided doses	–	–

[a]Strength of recommendation and quality of evidence is used as previously reported [96].
[b]Tetracycline antibiotics are generally contraindicated in children under 8 years because of the dose-dependent risk of staining of permanent teeth; however, these antibiotics are superior therapy for Rocky Mountain spotted fever and doxycycline is the drug of choice for therapy of this life-threatening disease in patients of all ages. Shorter treatment courses may be warranted in some pediatric settings; however, therapy should be continued for at least 48 h following lysis of fever and evidence of clinical improvement.
[c]Tetracycline antibiotics are generally contraindicated during pregnancy because of the risks associated with interference in the development of teeth and long bones in the fetus. However, because Rocky Mountain spotted fever is a life-threatening illness, and because of the demonstrated superiority of doxycycline as therapy for this infection, this drug represents the antibiotic of choice.
I: Evidence from ≥1 properly randomized controlled trial; II: Evidence from ≥1 well-designed clinical trial without randomization; from cohort or case–controlled analytical studies; III: ≥ Evidence from opinions of respected authorities based on clinical experience, descriptive studies or reports from expert committees; A: Good evidence; B: Moderate evidence; C: Limited evidence to support a recommendation for use; D: Limited evidence does not support a recommendation for use; SFG: Spotted fever group;
Data taken from [3,5,29,37–39,50,82,95].

Botelho-Nevers E, et al., Expert Rev Anti Infect Ther. 2012 Dec;10(12):1425-37

Analysis of risk factors for malignant Mediterranean spotted fever indicates that fluoroquinolone treatment has a deleterious effect

Elisabeth Botelho-Nevers[1,2], Clarisse Rovery[1], Hervé Richet[1] and Didier Raoult[1]*

J Antimicrob Chemother2011;66: 1821–1830

Table 5. Results of the multivariate analysis

Variable	*P* value	Odds ratio	95% Confidence interval
Tobacco use	0.037	7.008	1.120–43.867
Dehydration	0.011	11.795	1.764–78.853
Hyponatraemia	0.021	7.972	1.369–46.435
Use of corticosteroids	0.707	1.697	0.108–26.701
Doxycycline regimen	0.616	1.635	0.239–11.187
Fluoroquinolone regimen	0.031	9.767	1.234–77.291
β-Lactam regimen	0.344	2.215	0.427–11.489

The severe form of the disease was used as the dependent variable and tobacco use, dehydration, hyponatraemia, use of corticosteroids, doxycycline, fluoroquinolones and β-lactam regimens as independent variables.
Hosmer and Lemeshow test: $P=0.990$.

Journal of Antimicrobial Chemotherapy

Deleterious effect of ciprofloxacin on *Rickettsia conorii*-infected cells is linked to toxin–antitoxin module up-regulation

Elisabeth Botelho-Nevers, Sophie Edouard, Quentin Leroy and Didier Raoult*

Antibiotic treatment recommendations for facultative intracellular bacteria–related diseases

Disease	Adult	Child
Legionellosis	Levofloxacin 750mg Azithromycin 500mg 7-10 days	Erythromycin 50 mg/kg/day *or* newer macrolides
Acute brucellosis	Doxycycline 100mg bid with rifampicin (rifampin) 300mg tid or with Gentamicin 5mg/kg 6wk	**Age >8y:** doxycycline 2.5 mg/kg bid with rifampicin 20mg/kg/day or with streptomycin 1.5-2.5 mg/kg/day, 6wk **Age <8y:** cotrimoxazole (trimethoprim-sulfamethoxazole) 25-5 mg/kg/day bid with rifampicin 20 mg/kg/day or with streptomycin 1.5-2.5 mg/kg/day, 6wk
Typhoid	Azithromycin 1g then 500 mg 5-7 days *or* ceftriaxone 2g IV/IM, 7-10 days or cotrimoxazole 800-160mg bid, 14 days	Ceftriaxone 100 mg/kg/day , 7-10 days *or* cotrimoxazole 25-5 mg/kg bid, 14 days
Salmonella enteritis	Ciprofloxacin 500mg bid, 5 days *or* ceftriaxone 2g IV/IM, 5 days *or* cotrimoxazole 960mg bid, 5-7 days	Cotrimoxazole 25-5 mg/kg bid, 5-7 days if necessary
Yersiniosis	Gentamicin 3mg/kg/day in 2-3 doses, 7-14 days *or* doxycycline 100mg bid, 7-14 days *or* ciprofloxacin 500mg bid, 7-14 days	Gentamicin 3 mg/kg/day in 2-3 doses, 7-14 days
Mycoplasma hominis	Doxycycline 100mg bid, 7 days *or* clindamycin 500mg qid, 7 days *or* ciprofloxacin 500mg bid, 7 days	
Ureaplasma urealyticum	Doxycycline 100mg bid, 7 days *or* erythromycin 500mg qid, 7 days	
M. pneumoniae	Azithromycin 500mg 5 days *or* doxycycline 100mg bid 7 days	Erythromycin 50 mg/kg/day, 14-21 days *or* newer macrolides
Bacillary angiomatosis and *Bartonella* endocarditis	Gentamicin 3 mg/kg/day in 2-3 doses with erythromycin 500mg qid or with doxycycline 100mg bid or with ceftriaxone 2g IM once daily, 4-6wk	Gentamicin 3 mg/kg/day in 2-3 doses with erythromycin 50 mg/kg/day or with ceftriaxone 100 mg/kg/day IM, 4-6wk

Abbreviations: bid = twice daily; IM = intramuscular; IV = intravenous; qid = 4 times daily.

S. aureus

S. aureus: bactérie intracellulaire!

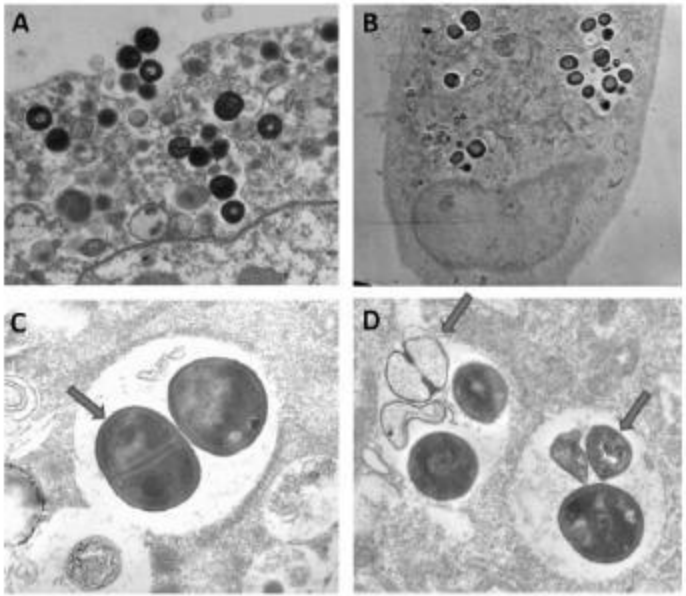

Fig. 1. Electron micrographs of different types of infected host cells. Adherence and uptake of *S. aureus* in epithelial A549 cells (A). Intracellular location of *S. aureus* after infection of primary osteoblasts (B). Dividing figure of *S. aureus* within an intracellular phagosome (C) and intracellular bacterial degradation (D) 24 h after infection of endothelial cells (HUVEC).

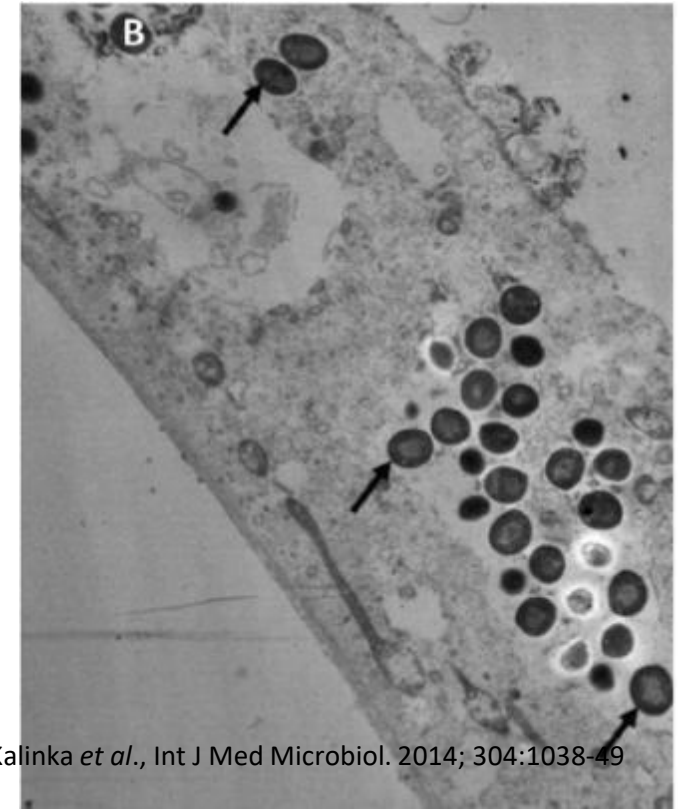

Kalinka *et al.*, Int J Med Microbiol. 2014; 304:1038-49

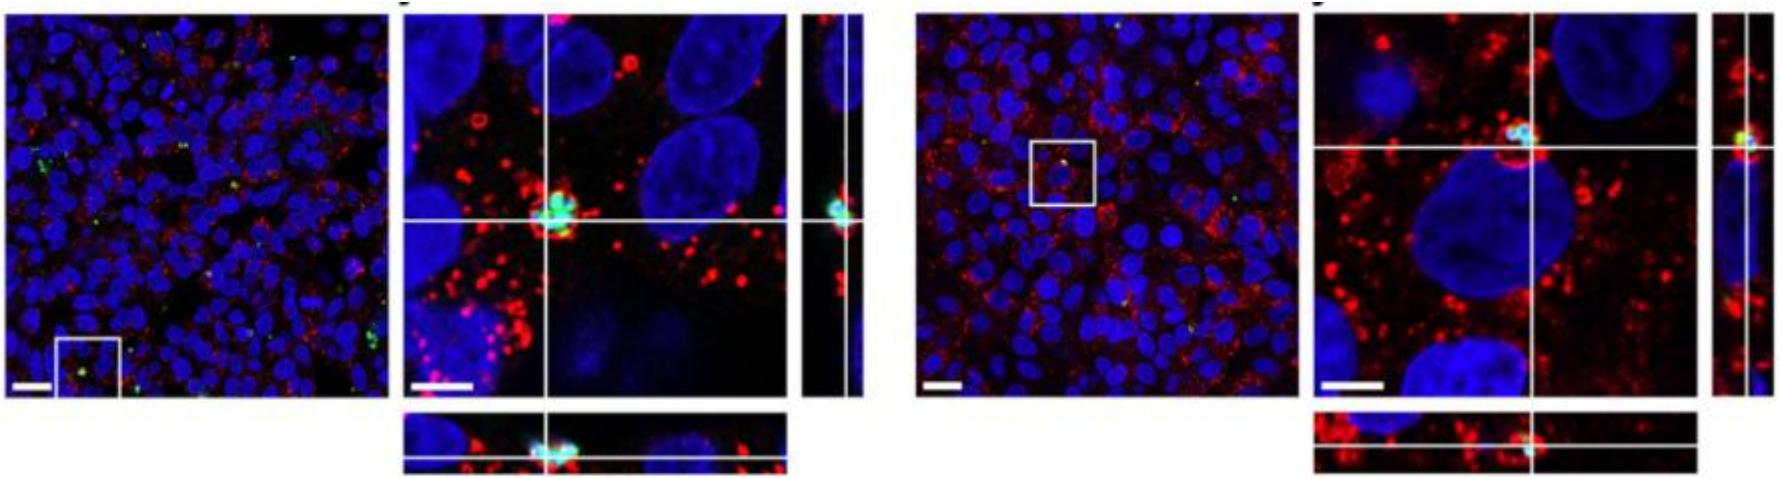

Figure 2. Intracellular persistence of *Staphylococcus aureus* within phagolysosomes. A549 cells were infected with *S. aureus* Cowan, and extracellular bacteria were killed by addition of flucloxacillin (1 mg/mL). *A*, The number and phenotype of viable intracellular persisting bacteria were determined at indicated time points. Data are mean values (±standard errors of the mean) pooled from 2 experiments performed in triplicate. *B*, The intracellular localization of persisting bacteria (CFSE; green) was analyzed by fluorescence microscopy. Lysosomes were visualized with LAMP-2 antibody (Alexa Fluor 594; red) and nuclei were stained with DAPI (blue). Scale bars 20 μm and 5 μm, respectively. Abbreviations: CFU, colony-forming units; SCV, small-colony variant.
