# ConjointVac: choix discrets à profil unique

## Scenario 1

- **Few of your colleagues** are vaccinated.
- The **management asks** the staff to get vaccinated, to protect patients and reduce days of work lost.
- **Several of your patients** have already been ill with this disease this month.
- The vaccine allows **avoiding 30% of cases for a duration of 1 year**.
- After vaccination, you can wear a **badge "I am vaccinated"**.
- By getting vaccinated, you also **protect your patients**.
- The vaccine's safety profile is well known, it **marginally increases the risk of developing a neurological disease**.

### Question:

Do you accept to get vaccinated now?

- Yes
- No

If yes, up to which minor side effect would you accept getting vaccinated?

- Pain during injection
- Pain in the arm during three days
- Redness and swelling at the injection site during one day.
- One day of fever during which you need to stay in bed.

## Scenario 2

- **Most of your colleagues** are vaccinated
- The **management does not give any message** regarding this vaccination.
- The epidemic situation **is normal**.
- The vaccine allows avoiding **90% of cases for a duration of 3 years**.
- If vaccinated, you can **wear a badge « I'm vaccinated »**.
- The vaccine provides **only individual protection**.
- This vaccine is **recent but no severe side effect** is known.

### Question:

Do you accept to get vaccinated now?

- Yes
- No

If yes, up to which minor side effect would you accept getting vaccinated?

- Pain during injection
- Pain in the arm during three days
- Redness and swelling at the injection site during one day.
- One day of fever during which you need to stay in bed.

# ConjointVac: niveaux d'attributs

Attributes	Levels
Vaccine Efficacy	1 - The vaccine has 90% efficacy. 2 - <b>The vaccine has 50% efficacy.</b> 3 - The vaccine allows prevention of 90% of COVID-19 cases, including severe forms.
Indirect Protection	1 - It is unknown if the vaccine prevents virus transmission to those around you in case of infection. 2 - <b>If you are infected, the vaccine will stop you from becoming sick from the disease, but it will not stop you from spreading the virus to those around you.</b> 3 - With the vaccination, you will contribute to the control of the COVID-19 epidemic. 4 - The vaccination will allow you to meet without risk older people of your family and patient roster.
Vaccine Safety	1 - The clinical trials show an absence of severe and frequent side effects. 2 - <b>The scientific data suggests that even if you are young, the benefit that the vaccine provides is much larger than the hypothetical risk that we cannot yet rule out.</b> 3 - The vaccine safety is strictly monitored in a joint effort of European countries.
Protection Duration	1 - Annual vaccine will be necessary. 2 - <b>The duration and efficacy of the vaccine protection are yet unknown.</b> 3 - The vaccination will probably be effective for a duration of 3 years.
Recommendation/ Incentive	1 - The ministry of health asks healthcare workers to get vaccinated. 2 - The vaccination recommendation is issued by a group of health professionals and scientists without any conflict of interest in relation to the vaccine producers. 3 - 80% of healthcare workers in other European countries have been vaccinated.

# Quel pourcentage accepte tout?

## (accepte tous les scénarios dans une étude de choix discrets)

Grippe 2018: N=1214 hospitaliers, 72% infirmiers, 11% médecins

Covid-19: décembre 2020 - février 2021, N=5234, 23% infirmiers, 9% AS-AH, 28% biomédicaux

	Grippe (2018)		Covid-19 (début de campagne)	
	tous	Par catégorie	tous	Par catégorie
acceptent <b>tous</b> les scénarios	19.4%	Infirm.: 16.5% Med: 37.5%	43.9%	Infirm.: 34.4% AS-AH: 20.0% Biomed 67.0%
acceptent <b>certains</b> scénarios	70.8%	Infirm.: 73.0% Med: 58.6%	38.9%	Infirm.: 46.0% AS-AH: 40.6% Biomed 27.3%
n'acceptent <b>aucun</b> scénario	9.9%	Infirm.: 10.6% Med: 3.9%	17.2%	Infirm.: 20.7% AS-AH: 39.4% Biomed 5.7%

# Qu'est-ce qui importe pour changer vers l'acceptation?

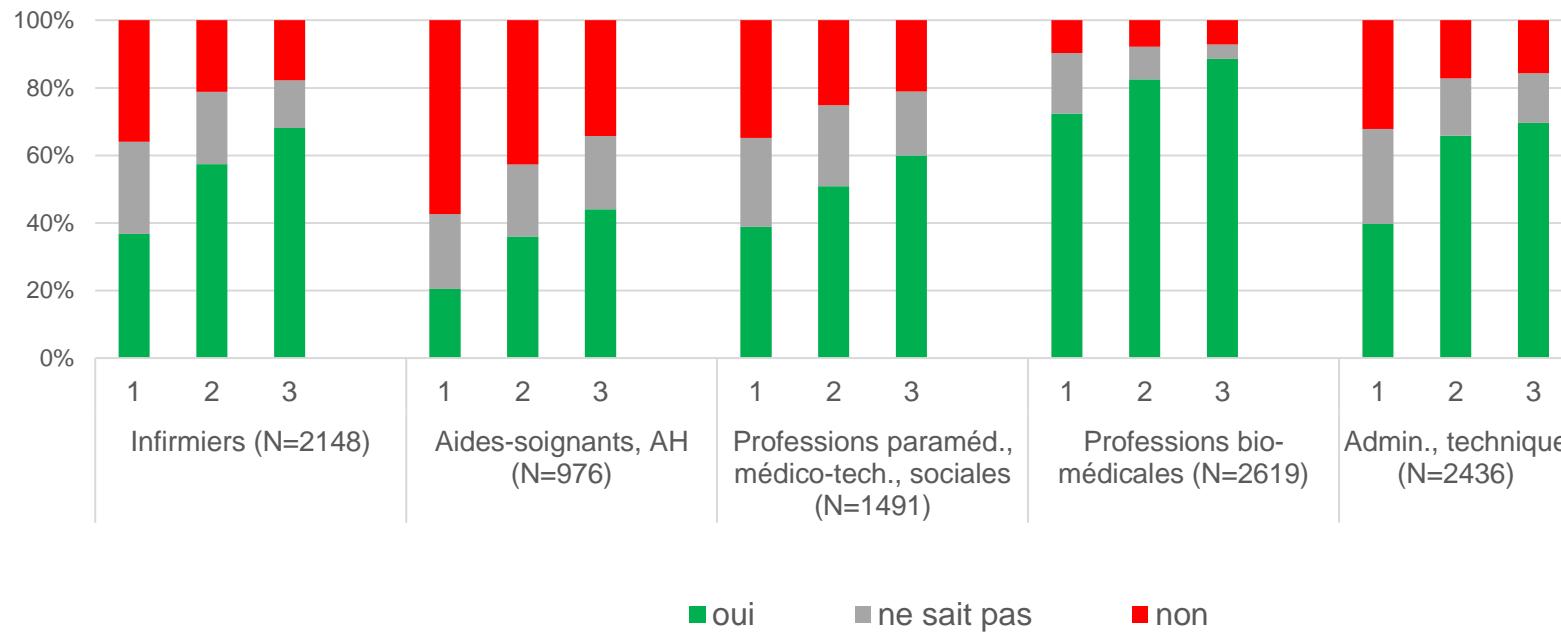

## Préférences vaccination anti-grippale (2018) :

- + Situation épidémique
- + Contrôle de maladie, protection famille et patients
- + Efficacité élevée et durable
- + Autres collègues vaccinés
  - aucun effet : message de la direction
- Controverse sur sécurité, proposition de badge

## Préférences Covid-19 (début de campagne) :

- + Contrôle de l'épidémie
- + Ne pas contaminer personnes âgées
- Efficacité 50% (vs 90%), durée de protection inconnue
- Pas de protection indirecte
- « BBR favorable » vs. vaccin sans EI fréquent et sévère

# Evolution de l'intention vaccinale Covid-19 (début de campagne)

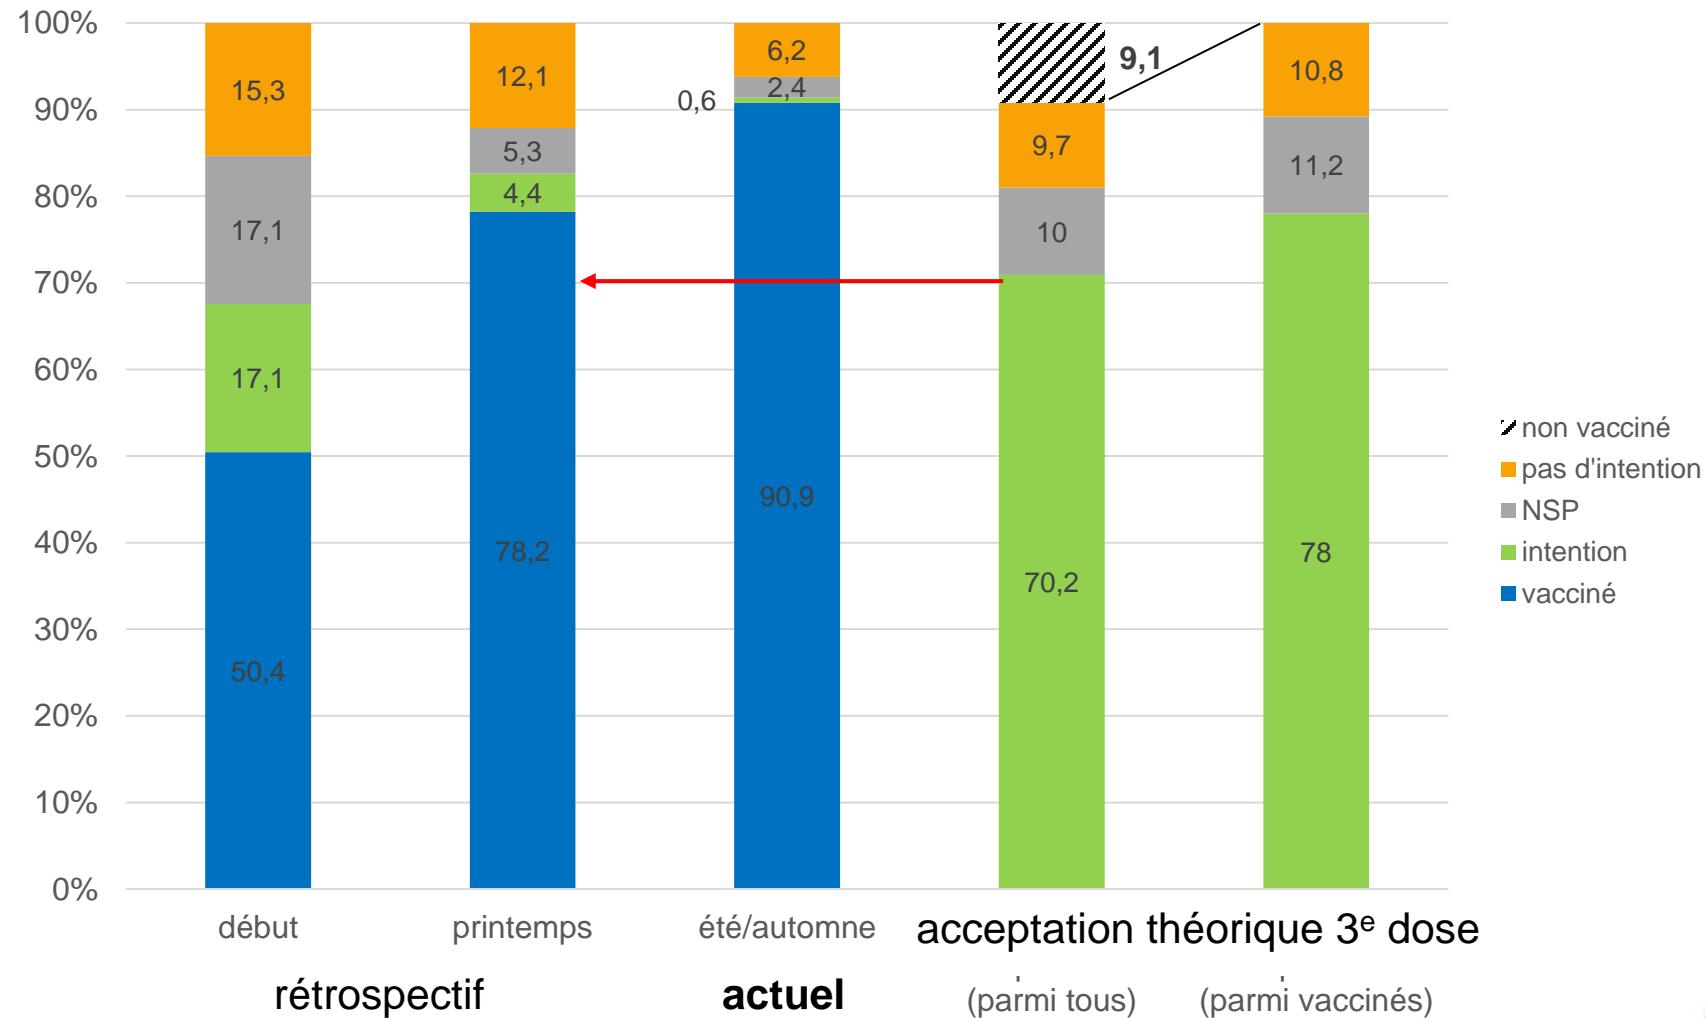

3 périodes de participation :

- du 18/12/20 au 4/01/21** : avant et à partir du lancement de la campagne dans les EHPAD
- du 5/01 au 14/01** : à partir de l'ouverture de la vaccination au personnel de santé de plus de 50 ans,
- du 15/01 au 1/02/21** : à partir des annonces gouvernementales de généralisation du couvre-feu à 18h et d'extension de la vaccination à l'ensemble des personnes de plus de 75 ans et à celles porteuses de certaines maladies chroniques

# Et après l'annonce de l'obligation ?

15 juillet – 10 novembre 2021, N=339, 34% infirmiers, 6% AS/AH, 30% biomédicaux

# A-7C, lien avec intention/statut de vaccination

décembre 2020 - février 2021, N=5234, 23% infirmiers, 9% AS/AH, 28% biomédicaux

# Conclusion

---

1/3 des professionnels de santé (biomédicaux: 2/3) accepte facilement la vaccination, peu importe les caractéristiques

2/3 acceptent en fonction des caractéristiques (= « hésitent ») (biomédicaux: 1/3)

Les caractéristiques importantes sont l'efficacité, la protection indirecte, la sécurité, ...

L'intention vaccinale contre la Covid-19 était dynamique dans le temps (avant obligation)

Acceptation théorique d'une nouvelle dose (hors obligation) inférieure au statut vaccinal au printemps 2021

=> pas d'effet positif de l'obligation sur la future intention

=> relation avec l'employeur facteur dominant pour l'intention?

# Merci !
