Eléments d'inquiétude liés à *Candida auris*

1. Difficult to identify
2. Usually fluconazole resistant, some multi-drug resistant strains
3. High crude mortality reported from some outbreaks
4. Propensity for nosocomial spread patient to patient in high risk settings
5. Persists in the hospital environment
6. Often fails to respond to normal infection control procedures
7. Global spread with simultaneous emergence on at least three continents
8. Now documented from five continents since recognition in 2009

Candida auris : émergence globale

Sporadic introductions

Simultaneous emergence on 3 continents

Large outbreaks with imported strains

- 2009 Japanese - ear discharge
- Chronic otitis media S. Korea
- Nosocomial blood stream infection Korea , Japan, Malaysia

- Multiple hard to control outbreaks reported from India and Pakistan
- High mortality rates (60%)

- S. Africa/Kenya ongoing nosocomial spread many hospitals
- Several thousand patients
- 70-80 per month

- Venezuela large multi-centre outbreaks
- 38% mortality, neonatal unit 28%
- Columbia 35% mortality

Candida auris: Internationally

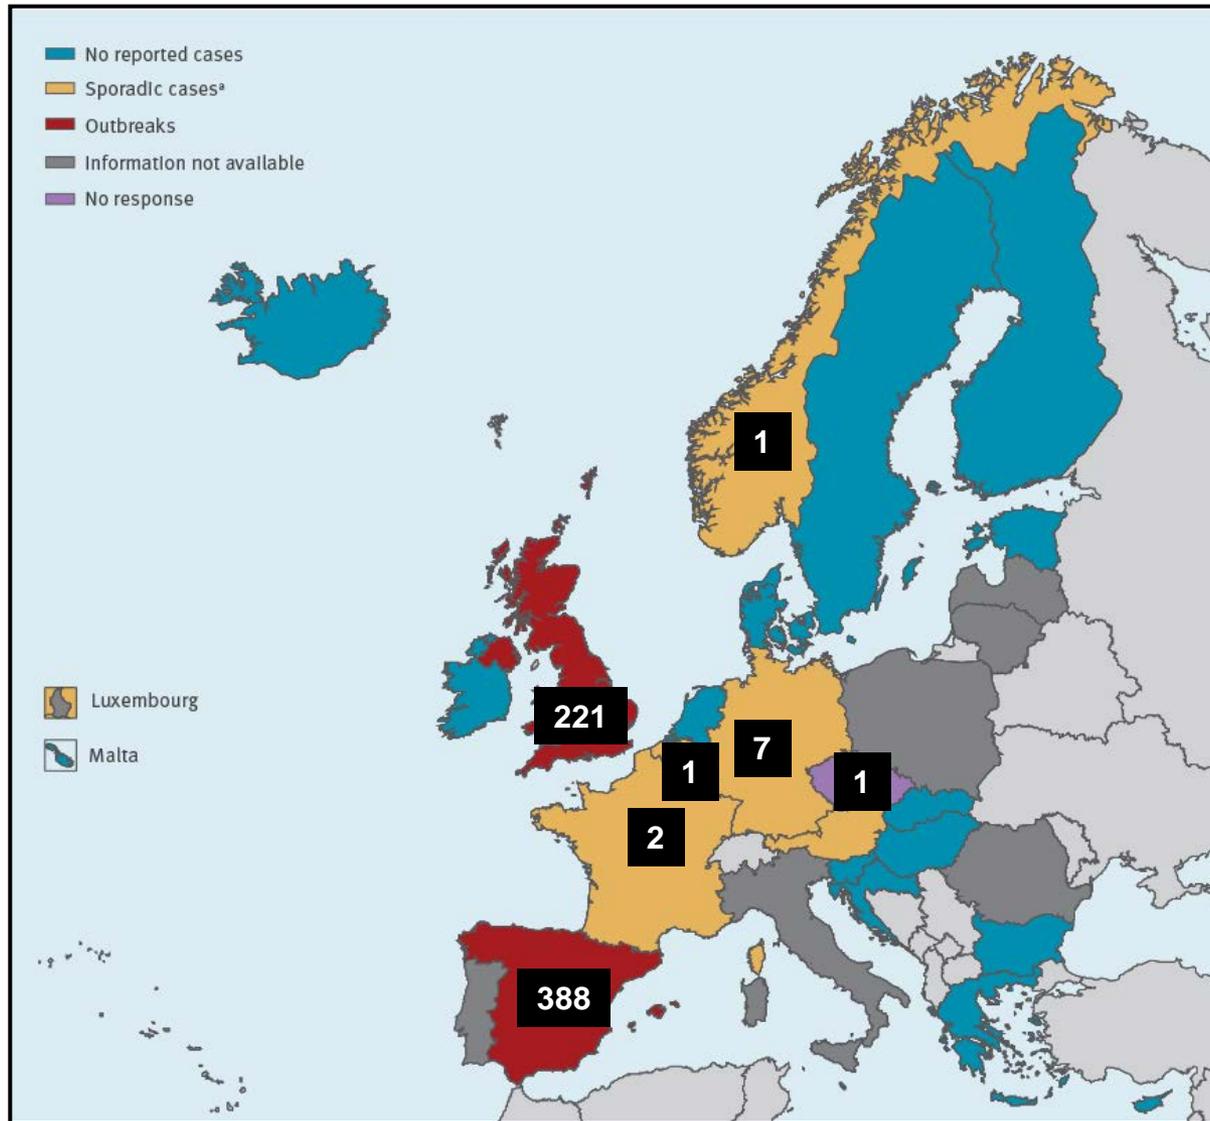

Multiple introductions and subsequent transmission of multidrug-resistant *Candida auris* in the USA: a molecular epidemiological survey.

Chow N.A. *et al.* Lancet Infect Dis 2018

Figure 1: Distribution of *Candida auris* clades within the USA

(A) Maximum parsimony phylogenetic tree of isolates from Colombia, India, Japan, Pakistan, South Korea, South Africa, Venezuela, and clinical cases in the USA (up to the first five clinical cases from each US state). (B) The frequency of clinical cases in the USA by clade. (C) The geographical distribution of clades; solid lines indicate introductions that are associated with patients known to have received health care abroad. CA=California. CT=Connecticut. FL=Florida. IL=Illinois. IN=Indiana. MA=Massachusetts. MD=Maryland. NY=New York. NJ=New Jersey. OK=Oklahoma. SNPs=single-nucleotide polymorphisms.

620 cases of *C. auris* isolation from EU/EEA countries 2013 - 2017

Colonisation
466 (75.2%)

Infection
150 (24.2%)

UK experience:

Multiple independent
introductions
25 UK centres
73 infections
41/73 candidaemia

3 outbreaks – one
ongoing

***Candida auris* infection and colonisation**

Types of infection encountered

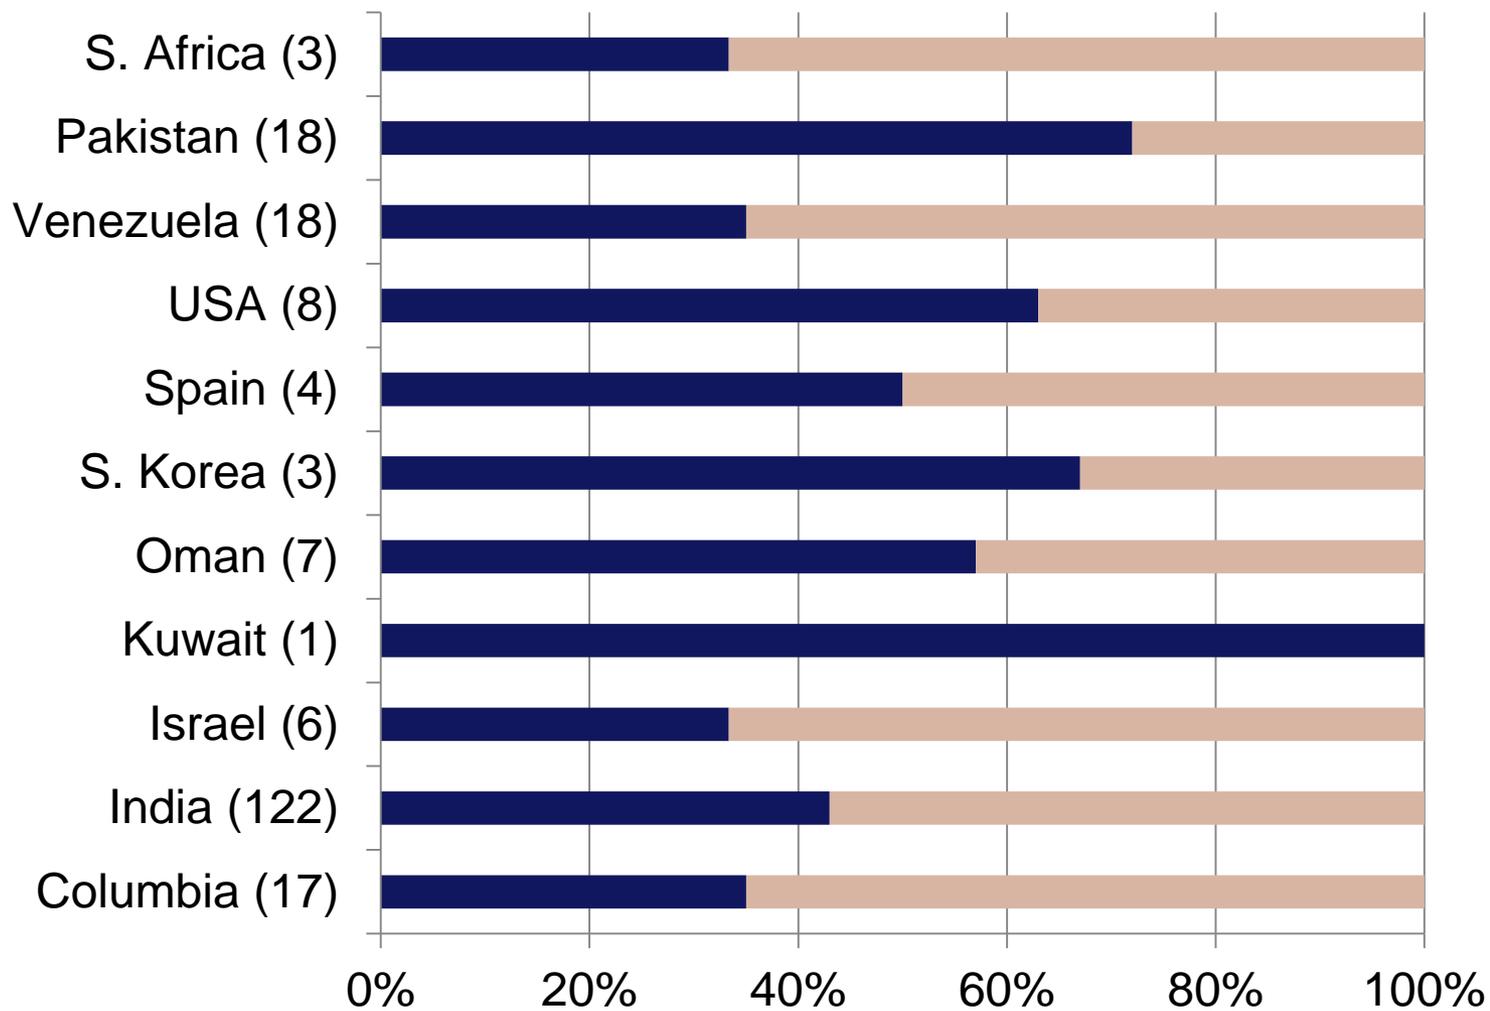

- Candidaemia
- Urinary tract / kidney infection
- Bile infection
- CSF infection
- Wound infection
- Respiratory
- Bone infection
- Ear infection
- Vaginal infection

Colonisation

- Axilla
- Groin
- Nose
- Throat
- Perineum and rectum
- Urine (stool rare)

Crude *Candida auris* mortality rate (%)

Sekyere 2018 Systematic Review e578 1-29

UK isolates to date 73 deep infections; 41 of which BSI no attributable mortality

Most common predisposing factors and conditions for *Candida auris* infection

- Diabetes mellitus (diabetic foot ulcers)
- Chronic kidney disease
- Peripheral vascular disease
- Surgery esp. abdominal, vascular
- Previous healthcare exposure
- Previous broad spectrum antibiotic / antifungal exposure
- Central venous catheter in situ (CVC)
- Total parenteral nutrition (TPN)
- ICU care
- Urinary catheterisation
- Mechanical ventilation / underlying respiratory illness
- Low APACHE II score

Chlorhexidine plus isopropyl more effective Iodine based skin disinfectant

Moore et al J. Hosp. Infect 2017

Surveillance de toutes les infections fongiques invasives en France

Envoi de tous les isolats d'espèces non fréquentes pour re-identification au CNR (MALDI-ToF et séquençage)

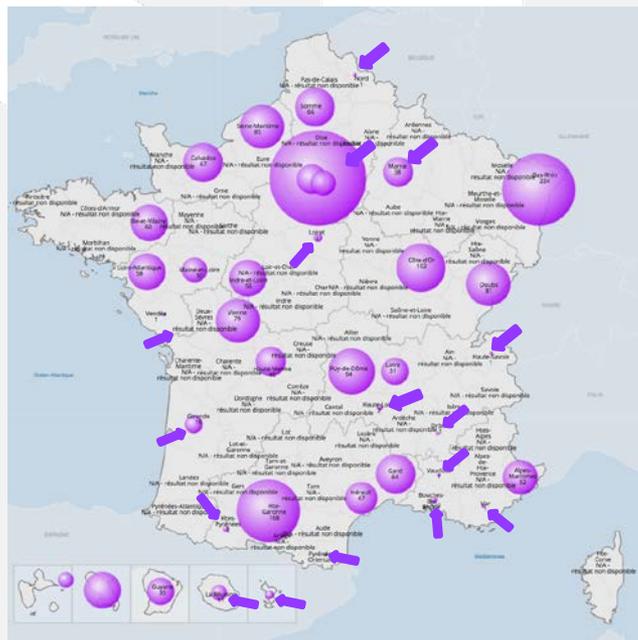

Fongémies

5576 dans l'ODL depuis 2002

5372 dans RESSIF depuis 2012

Isolats de *C. auris* en France (\pm CNRMA)

- 3 cas prouvés (une fongémie chez un patient hospitalisé à La Réunion en 2015, et deux colonisations (en 2017 à Tours*, et un en 2019 à La Réunion).
- 2 cas probables (2 colonisations, en 2015 et en 2016, à La Réunion), transmission nosocomiale entre deux cas de 2015.
- Rétrospectivement 1 abcès du foie en **2007** à Paris

Actions du CNRMA après l'alerte du CDC fin juin 2016

1. Alerte du CNRMA le 9 juillet 2016 à tous les mycologues français

Cher(e)s collègues et ami(e)s

Le CNRMA et la SFMM souhaitent porter à l'attention des mycologues français l'alerte que le CDC américain lance sur les infections à *Candida auris*. Le CNRMA n'a eu connaissance que deux cas d'infections invasives toutes les deux associées à des abcès profonds (l'une en 2007, l'autre en 2015). Les deux souches avaient des CMI très hautes pour le fluconazole mais seulement modérément augmentées pour les autres azotés testés (voriconazole et posaconazole), et pour les échinocandines.

Si d'autres cas d'infections invasives étaient diagnostiqués dans vos centres, il est important que le CNRMA puisse colliger les cas et tester les souches avec la technique EUCAST

2. Nouvelle alerte du CNRMA en novembre 2016 en lien avec SPF

... *Si des cas d'infections invasives étaient diagnostiqués dans vos centres, il est important que le CNRMA puisse colliger les cas et caractériser les souches. A noter que cette espèce est facilement confondue avec Candida haemulonii.*

3. Envoi des profils MALDI-TOF de nos souches à la base inter-CHU (R. Piarroux), et contact avec les fabricants Brücker, BioMérieux et Andromas

Probablement utile à Tours, 31 août 2017...

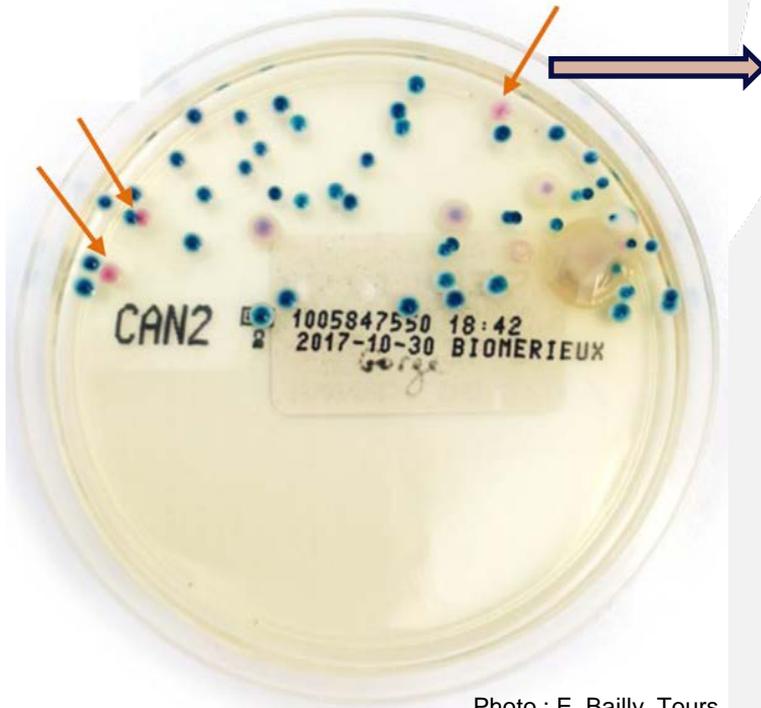

Photo : E. Bailly, Tours

Ecouvillon buccal : *C. albicans* + *C. tropicalis* + *C. glabrata*, + quelques colonies de ???

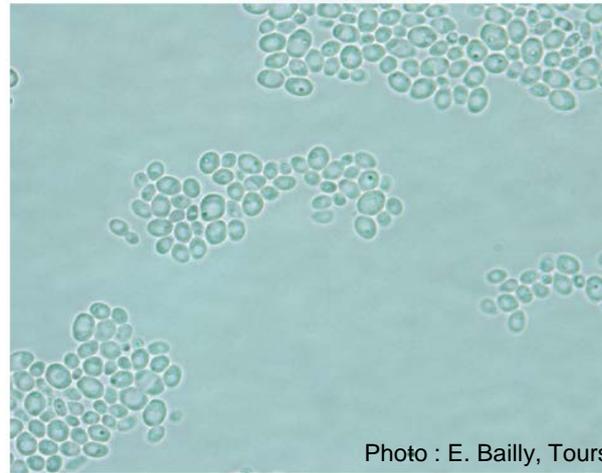

Photo : E. Bailly, Tours

Levure d'aspect banal sur les milieux de culture habituels

♂ 58 ans

Bilan pré-transplantation en Iran et Inde
Hospitalisé pour transplantation hépatique

Porteur bactéries multi-résistantes*

- + *Escherichia coli* carbapénémase
- + *Enterococcus faecium* vancomycine-R
- + *Escherichia coli* BLSE

Mesures prises à Tours ...

1. Isolement du patient à cause des BMR
2. Envoi de la souche au CNR pour suspicion de *C. auris* en raison des identifications fantaisistes
3. Cartographie positive (gorge, anse intestinale, rectum, urines) mais aucune hémoculture (0/23)
4. Décontamination du laboratoire * :
 - Confinement des cultures (sacs plastiques)
 - Traitement des surfaces et des sols (javel 2,6%)
 - Décontamination des PSM (UV, nettoyage)

*Welsh et al. J. Clin. Microbiol 2017

Quel est le risque de méconnaître un cas ?

1. Risque lié aux techniques et aux bases de données *

- Auxanogramme API20C® (BioMérieux) : *Rhodotorula glutinis* (id.= 98,3%)
- Auxanogramme ID32C® (BioMérieux) : *Candida sake* (id. = 98,1%)
- Système Vitek 2® compact (BioMérieux) : *Candida famata*
 - **Maldi-TOF (Brucker)**: *Candida auris* mais mauvais score (<2)
 - **Maldi-TOF (VITEK MS)** : *pas d'identification* car espèce absente actuellement (mais sera dans la V3.2 base IVD et est présente la 4.15 de la base recherche RUO)

• 2. Risque lié aux procédures

De nombreux laboratoires n'identifient pas les espèces non *albicans*

Envoi au CNRMA en URGENCE pour identification / confirmation si ...

Dans le contexte d'émergence possible de *C. auris*, il est important d'identifier les espèces pour mettre en place les mesures d'isolement adéquates

1. Hospitalisation récente >1 j dans un pays ayant déclaré des épidémies de *C. auris*
A fortiori si colonisation ou infection par une BMR *
2. Si espèce non-*albicans*
 - Identifiée comme *C. haemulonii*, *C. dobuhaemulonii*, *C. sake*, *C. famata* par Vitek2/Auxacolor/Api
 - Ou non identifiée par MALDI-TOF
 - *A fortiori* si sensibilité diminuée au fluconazole
3. Si espèce identifiée *C. auris*

* Eyre et al. N. Engl. J. Med. 2018

Conclusion: *Candida* haut *risque*

Sur le plan international:

1ere évidence d'introduction multiple et indépendante, mondiale, d'une espèce de *Candida*, suivie de transmission nosocomiale

Différentes populations clonales avec virulence/sensibilité in vitro variables ;
acquisition rapide de résistance croisée

Sur le plan national:

Tout cas d'infection ou de colonisation à *Candida auris* doit faire l'objet d'un signalement e-Sin et auprès du CNRMA

CNRMA:

- envoi souches suspectes ou identifiées comme *C. auris* pour confirmation ou identification en urgence (<3h).
- déterminer le profil de sensibilité aux antifongiques (EUCAST).

Enquete sur voyages dans zones à haut risque + isolement/cohorting des pts porteurs avec mesures hygiènes accrues, détection des contacts + désinfection locaux

Echinocandine en 1ere intention si infection invasive
